Letter of transmittal 11
- Geographical distribution 11
- General health of the Army 12
- Typhoid fever 13
- Malarial fevers 13
- Measles 14
- Tuberculosis 14
- Venereal diseases 15
- Alcoholism 16
- Legislation 16
- Army Medical School 17
- Library of the Surgeon General 17
- Army Medical Museum 18
- Medico-military observers of European war 18
- Army Nurse Corps 19
- Hospital train 19
- Expedition into Mexico 20
- Mobilization of the National Guard 20

Health of Army:
- Remarks international nomenclature 22
- Remarks method compiling admission rates 22
- Officers 23
  - Officers retired and deaths 23
- Enlisted men 24
  - Strength 24
  - Admissions to sick report 25
  - Constantly noneffective rate 26
  - Discharges for disability 26
  - Deaths from all causes 30
  - Influence of station on troops 31
  - Influence of arms of service 40
  - Influence of race 45
  - Comparison with foreign armies 46
  - Surgical operations 46

United States, continental, exclusive of Alaska 48
- Admission rates 48
- Constantly noneffective rates 48
- Discharges for disability 48
- Deaths 54
- Prevalence of special diseases 57
  - Typhoid fever 57
  - Paratyphoid 64
  - Venereal diseases 66
  - Malaria 71
  - Tuberculosis 72
  - Undetermined fevers 75
  - Mental alienation 75
  - Alcoholism 75
  - Smallpox 77
  - Measles 77
  - Poliomyelitis, epidemic of 77
  - Cerebrospinal meningitis 78
- Influence of station 78
- Influence of race 79
- Influence of season 88
- Sanitation, United States 89
  - Camp sanitation 93
  - Water supply 98
  - Barracks and quarters 99
  - Clothing 99

INDEX OF TABLES, BY SUBJECTS.

ARMY, AMERICAN TROOPS.

1. Retirement of officers for disability, by causes and rank, grouped by ages, 1915 23
2. Deaths of officers, by causes and rank, grouped by ages 24
3. Numerical view of the effect of disease and injury on United States troops serving at home and abroad in the year 1915, compared with corresponding data for the year 1914, by countries. Same data for native troops in Philippines and Porto Rico 37
3A. Same for Army (entire) 39
4. Influence of disease on enlisted American troops, Army, by arms of service, 1915 40
5. The relative frequency of occurrence of certain important diseases, by arms of service, 1915 40
9. Typhoid fever in the Army, 1915 59
10. Paratyphoid fever in the Army, 1915 65
12. Venereal diseases, entire Army and United States proper, enlisted men 66
13. Venereal diseases, admissions and discharges, 1915, Army, enlisted American troops 66
18. Venereal diseases, Army, officers and enlisted men, by departments and divisions, 1915 70
22. Occurrence of tuberculosis (all) American troops (enlisted) for the Army, by years of service, for 1915 74
23. Undetermined fevers, enlisted American troops, by countries, 1915 75
46. Comparison of rates for the several countries garrisoned by the Army 157
47. Dental and oral diseases 220
66. Surgical operations performed by officers of the Medical Corps on officers and enlisted men of the Army during 1915 238
67. Numerical view of the effect of disease and injury on United States troops serving at home and abroad for 1915, by races, compared with 1914 255
68. Admissions to sick report, discharges, and deaths, ratios per 1,000, 1915, compared with data for the years 1905-1914, Army 256
68½. Admissions to sick report, discharges, deaths, and noneffectiveness, with ratios per 1,000 of mean strength, for the Army, separately for officers, total enlisted (including American, Porto Rican, and Philippine troops) and grand total, year 1915 260
69. Admissions, discharges, noneffective, and deaths, with ratios per 1,000 for the Army, 1915, officers, total American troops, and grand total 266
70. Admissions, discharges, noneffective, and deaths, with ratios per 1,000 for the enlisted men of the Army, white and colored, 1915 272

Page.
76. Admissions to sick report, discharges, deaths, and noneffectiveness, with ratios per 1,000 for American troops (enlisted) on duty at home stations, compared with the same data for those serving at distant stations, 1915 .. 326
80. Comparative figures, Army, 1911–1915, enlisted men 336
81. Admissions and cases compared, 1904–1911, inclusive 337

RECRUITING, AMERICAN TROOPS.

48. Movement of recruits, white and colored, 1915 221
49. Nativities of accepted recruits, 1915 221
50. Ages of recruits, white and colored, and the proportion at each age per 1,000 accepted 222
51. Relation of height to age, white troops 222
52. Relation of height to age, colored troops 223
53. Relation of weight to age, white troops 224
54. Relation of weight to age, colored troops 225
55. Relation of chest measurement to age, white troops 226
56. Relation of chest measurement to age, colored troops 226
57. Causes of rejection by medical officers, United States Army, of candidates examined for enlistment, 1915, white and colored 227
58. Principal occupation of recruits, first enlistment 228

UNITED STATES ONLY, AMERICAN TROOPS.

7. Discharges for disability, 1915, United States, continental (exclusive of Alaska) 48
8. Deaths among officers and enlisted men serving in United States, 1915 54
9. Typhoid fever in the Army, 1915 59
10. Paratyphoid fever in the Army, 1915 65
12. Venereal diseases, entire Army and United States proper, enlisted American troops 66
13. Venereal diseases, admissions and discharges, 1915, Army, enlisted American troops 66
14. Venereal diseases, by years, 1911–1915, enlisted men 67
15. Syphilis, United States, enlisted men, 1911–1915 68
16. Total admissions for venereal diseases, officers and enlisted men, at recruit depots, 1913, 1914, 1915 68
17. Venereal diseases at larger posts 69
18. Venereal diseases, Army, officers and enlisted men, by departments and divisions, 1915 70
19. Malarial infections, officers and enlisted men, United States, continental (exclusive of Alaska), 1911–1915 71
20. The 10 posts in the United States having the highest admission rate for malarial diseases, 1914 and 1915 71
21. Tuberculosis (all) at Army stations, United States, continental (exclusive of Alaska), 1915, compared with 1913 and 1914 73
22. Occurrence of tuberculosis (all) American troops (enlisted) for the Army, by years of service, for 1915 74
23. Undetermined fevers, Army, by countries, 1915 75
24. Posts with over 200 officers and enlisted men having the highest admission and noneffective rates, 1915, with ratios per 1,000 85
25. Posts having the lowest admission and noneffective rates, 1915, with ratios per 1,000 86
26. Influence of disease on enlisted men serving in the United States, continental (exclusive of Alaska), by arm of service, 1915 88
27. Influence of season, officers and enlisted men, United States, continental (exclusive of Alaska), 1915 88
70½. Admissions to sick report, discharges, deaths, and noneffectiveness, with ratios per 1,000 of mean strength, for the year 1915, United States, continental (excluding Alaska), and separately for officers, total enlisted men and grand total 278
71. Admissions, discharges, noneffective, and deaths, with ratios per 1,000 for the United States, enlisted men, white and colored, 1915 284
77. (Foreign table not used this year.)

REPORT OF THE SURGEON GENERAL OF THE ARMY.

WAR DEPARTMENT,
OFFICE OF THE SURGEON GENERAL,
Washington, September 1, 1916.

The SECRETARY OF WAR.

SIR: I have the honor to submit herewith the annual report upon the work of the Medical Department. This covers a study of the health and sanitary conditions of the Army for the calendar year 1915, and a financial statement for the fiscal year ending June 30 1916. I desire here to invite attention to certain matters of interest in this report.

GEOGRAPHICAL DISTRIBUTION.

The United States Army, aggregating approximately 100,000 men, had during the year 1915 a wide geographical range in its various activities. Troops were stationed in greater or less numbers from the sixty-sixth meridian of west longitude to the one hundred and fifteenth meridian east of Greenwich, and from the sixty-fourth degree north latitude to within 7° of the equator; distributed over two hemispheres, literally, from St. Michael to Mindanao, and from Porto Rico to Pekin.

The significance of this far-extended field of action in its relation to the health and disease of the Army is readily appreciated by the most superficial investigator, and to the student of vital and social statistics and their application to the comparative study of races and nations, it assumes a particular importance.

The medical officers of the Army in their capacity of sanitary advisers to the line, have thus had the opportunity of studying and applying the recent advances of modern preventive medicine under the most varied and interesting conditions.

In all the changing circumstances of garrison, camp, and field, the work of the Medical Corps has measured well up to the best traditions and to the highest standards of the profession. The success they have achieved is the result of earnest and painstaking effort coupled with the most important factors—the sympathetic cooperation and loyal support of those they served.

The following are the officers who have held, during the last year, the responsible position of department surgeon in the several military departments of the Army:

Col. Charles Richard, Medical Corps.
Col. Rudolph G. Ebert, Medical Corps.
Col. William H. Arthur, Medical Corps.
Col. Henry P. Birmingham, Medical Corps.
Col. William Stephenson, Medical Corps.
Col. Guy L. Edie, Medical Corps.

Col. William D. Crosby, Medical Corps.
Col. Charles M. Gandy, Medical Corps.
Col. Walter D. McCaw, Medical Corps.
Col. Henry S. T. Harris, Medical Corps.

GENERAL HEALTH OF THE ARMY.

The general health of the Army was excellent during the year 1915. There were no epidemics or unusual incidence of infectious diseases.

The mean strength of the entire Army for the calendar year 1915, upon which the statistics contained in the annual report are based, was 103,842.

The noneffective rate for the entire Army for 1915, from all causes, was 25.22 per 1,000 (for disease alone 20.85), which is slightly higher than that for 1914, the lowest noneffective rate in the history of the Army; but still much below the rates for any preceding year, except 1913, when the rate was 23.98. The noneffective rate during the past decade shows a steady reduction. In 1906 it was 47.86 per 1,000.

The admission rate for the entire Army for 1915, was 726.19, as compared with 660.45 per 1,000 for 1914. With the exception of 1913–14, the 1915 admission rate is the lowest in the last 10 years. The admission rate shows a marked decline since 1906, when it was 1188.00 per 1,000.

The death rate of the entire Army for 1915, from all causes, was 4.45 per 1,000, compared with 4.40 for 1914, which was the lowest mortality rate in the Army for many years. The death rate from disease was 2.53 per 1,000 for 1915; the same rate for 1914 was 2.35, and that for 1906 was 3.77.

The discharge rate for the year 1915, from all causes, was 14.06 per 1,000, somewhat higher than 1914, when the rate was 12.78 per 1,000, but still markedly less than the discharge rates prior to 1910, when they ranged from 16.64 upward.

The total losses of the Army, from all causes: Deaths, discharges, and retirements, was 18.03 per 1,000 for 1915; for the year 1914 it was 16.86, the lowest in the past decade.

Malarial fevers show the lowest noneffective rate in the history of the Army, 0.54. In 1906 the noneffective rate for malarial fevers alone was 2.55 per 1,000. The decade following has demonstrated the effectiveness of the antimalarial measures that have been unceasingly employed by the sanitary officers of the Army each year, exhibiting, with but two exceptions, a marked decrease in the incidence of the disease.

The record in the Philippines has been specially creditable compared with former years, though here, as in the Canal Zone, the Medical Department has been at some disadvantage, through lack o screening or other antimosquito requisites, due to insufficient appropriation of funds for this important work. There should be no further delay in properly screening all buildings in the Tropics occupied as hospitals, barracks, or quarters.

The highest noneffective rate, for disease alone, for 1915 was among the troops stationed in China, 31.78 per 1,000. Then follows in order: Panama with 21.66; the Philippine Islands with 21.42; th

United States, 20.90; Porto Rico, 20.57; and Hawaii and Alaska with the lowest noneffective rates for the year 1915, 16.20 for Hawaii and 6.02 for Alaska.

TYPHOID FEVER.

There were eight cases of typhoid fever in the entire Army during the year 1915; no deaths resulted, all making good recoveries. Of the eight cases mentioned, four only occurred within the continental limits of the United States; the four other cases of typhoid fever were reported from Hawaii.

During the Spanish-American War, from May 1, 1898, to June 30, 1899, the total number of deaths in our armies, Regular and Volunteer, was 6,619. This was equivalent to an annual mortality rate of 33.03 per 1,000 of strength; the rate for disease alone being 25.68. Typhoid fever was accountable for more than one-half of the deaths from disease. The total number of deaths from typhoid fever was 2,774—equal to an annual rate of 13.84 per 1,000.

In the United States the regulars lost 361 and the volunteers 1,890 from this fever; these numbers being equivalent to the respective rates of 7.78 and 18.21 per 1,000 of strength.

The record of the fight against typhoid fever in the United States Army during the decade and a half since the Spanish War, constitutes one of the most interesting and brilliant chapters in the history of preventive medicine, beginning with the epoch making investigation of the "Typhoid Fever Board" into the manner of infection and dissemination of the disease in the military camps of 1898, and culminating 12 years later in the equally notable adoption of antityphoid vaccination in the United States Army.

The results following compulsory vaccination in the Army are now well known and are exemplified by the record of the present year.

MALARIAL FEVERS.

Malarial fevers no longer occupy the high place of a few years past in the sanitary statistics of the Army, when they ranked well up to the top of the list of those diseases producing the greatest admission and noneffective rates in our service. These rates have been steadily falling for the past decade, with the exception of the year 1912, when an unavoidable exposure of troops in a tropical campaign occurred with a resulting increase in the number of cases. The control of the disease in the Philippines since that time deserves special notice.

The admission and noneffective rates for the year 1915 for these fevers are the lowest in our experience in the Far East. This result has been achieved in spite of a serious sanitary handicap existing at certain of the posts where lack of screening in barracks and quarters and a badly malarial infected native population in close proximity makes the task a discouraging and difficult one. Appropriation of adequate funds for the proper screening of all hospitals, barracks, and quarters in the Philippine Islands should not be further delayed.

The admission rate for the entire Army during 1915 was 25.16 per 1,000, and the noneffective rate was 0.54 per 1,000.

MEASLES.

Measles is a disease rarely considered as serious by the layman and the practitioner, who see only an occasional isolated case without complications. Under ordinary conditions the mortality from the disease itself is not high, but in certain epidemics occurring among nonimmune (native) populations, in large institutions, schools, and armies, pulmonary and middle-ear complications make measles the most formidable and deadly of the eruptive fevers.

In the United States Army, outside of the recruit depots, but few cases of measles occur, and these usually in a mild form. The experience with the disease at several of our recruit depots has been quite otherwise, however. At these depots, during the winter months the period of most active recruiting, large numbers of young adults are assembled for instruction and equipment. A great many of these youths are from the country districts and particularly susceptible to infectious disease. Given cold weather, necessitating indoor life, an overcrowded barracks, young and nonimmune individuals in connection with the appearance of a specially virulent form of measles such as has repeatedly prevailed at Columbus Barracks, Ohio, and Jefferson Barracks, Mo., and you have the conditions which make an epidemic of measles much more to be feared than smallpox.

As has been stated, respiratory complications, particularly bronchopneumonia and empyema, together with frequent involvement of the middle ear, inevitably results in a high mortality and discharge rate.

The insidious onset of this disease among recruits and its rapid spread, when once started, through congested quarters, has, in the past, necessitated the cessation of recruiting for months and the rapid evacuation of the depots; all ordinary methods for the control of those epidemics having proved unavailing.

The chief factor in the spread of measles, as it has appeared in our Army, has resulted almost always from the overcrowding of susceptible and infected recruits.

Before another season brings its usual round of cases, complications, and criticisms, prompt steps should be taken by the proper authority to provide at all of these recruit depots, and particularly at Columbus Barracks, Ohio, and Jefferson Barracks, Mo., the much-needed and often-recommended additional barracks.

TUBERCULOSIS.

Tuberculosis is the cause of the highest death rate in all armies under peace conditions, differing in no way in this respect from the experience among the civilian population, where it produces the greatest mortality of any infectious disease.

In the United States it has been stated that tuberculosis is responsible for approximately one-tenth of the deaths annually.

The difficulty of recognizing this disease in its early stages accounts in part for its appearance among soldiers in spite of the rigid and thorough physical examination to which they are subjected on admission into the service.

All cases of tuberculosis among American troops are sent, withou delay, to the United States Army General Hospital, Fort Bayard N. Mex., for prolonged treatment, if necessary, under climatic and other conditions most favorable for the arrest of the disease. The Army General Hospital at Fort Bayard, N. Mex., is intended, primarily, only for those who have pulmonary tuberculosis. The highly creditable record of cases in this hospital, for a decade or more, under the command of Col. George E. Bushnell, Medical Corps, a very distinguished authority on all that relates to tuberculosis, has been a gratifying feature of Army medical administration.

The admission rate for this disease for the entire Army for 1915 was 3.49 per 1,000.

VENEREAL DISEASES.

Venereal diseases still continue to constitute in the Army of the United States, as in those of other countries, a very serious factor against military efficiency of the Army, just as in civil life these same diseases occupy a similar commanding and threatening position in their relation to the welfare and usefulness of the community and State.

It should be clearly understood that the Army sanitarians and the military authorities generally are fully aware at this time, as they have been for many years past, of the necessity and importance of attacking and limiting by every possible means these so-called social diseases. To that end there have been formulated and put into vigorous operation measures designed to control to the greatest degree possible these infections, which always have their origin, so far as the soldier is concerned, quite outside of his military life and duties and far removed from any military authority or discipline. It is believed that no more comprehensive system of attack against a disease has ever been instituted in the Army or elsewhere than that at present in active operation in the United States Army.

It includes, among other features, regular medical examinations twice a month; prompt isolation, quarantine, and hospital treatment until cured of all found with infective conditions; court-martial and stoppage of pay; the hearty encouragement of athletic games and sports of all kinds; the furnishing of rational amusements; libraries, opportunity for study and for school; the best of food and clothing; and last, but not least, an earnest appeal to the moral and ethical side is not neglected.

In brief, the Army is controlling its own limited area and is successful within its garrisons and camps. The same measures, or similar ones, adopted by nearby civil communities would be equally effective. Until either the sex instinct is abolished or much altered, or Federal control is invoked as in certain other diseases far less threatening, we may expect that the disability from this cause will continue. In the meantime there should be no relaxing of effort on the part of the Army. The fight will be vigorously continued, with constant hope for increasing assistance and cooperation from the civil communities whose interests are quite as vitally concerned as those of the Army.

In connection with the subject, attention is invited to the remarkable report of the Royal Commission on Venereal Diseases, lately published in England, and also particularly to the recent State legislation in Australia, dealing drastically with venereal infections of every character.

ALCOHOLISM.

The admission and noneffective rates for alcoholism in our Army have steadily diminished during the past decade and a half, keeping pace with the general public sentiment and decreased use of stimulents of this character among all classes in all walks of life in this country.

The Army has banished alcohol from its garrisons and camps and the Navy has eliminated it from its ships and yards. All this before the outbreak of the great war, the struggle which, if it proves nothing else, has demonstrated long since, by the similar action of the various nations engaged, that alcohol and military efficiency have nothing in common and must hereafter be held unqualifiedly antagonistic.

LEGISLATION.

As a result of legislation reorganizing the Army under the national defense act of 1916, the Medical Department was placed, for the first time in its history, upon a satisfactory basis. This is especially true of the commissioned personnel.

The Medical Corps was reorganized upon a basis of seven medical officers to each one thousand of the enlisted strength of the Army, the increase to take place in five annual increments. This increase will add 1,107 officers to the Medical Corps of the Army, raising the total from 443 to 1,550. The ratios in the various grades remain as provided by law in the act of April 23, 1908:

	Per cent.
Colonels	3.16
Lieutenant colonels	5.42
Majors	23.70
Captains and lieutenants	67.72

The Dental Corps was reorganized and the probationary contract system abolished. Dental surgeons are now commissioned as first lieutenants and after eight years' service promoted to captains. It is further provided that after 24 years' service, not to exceed 15 dental surgeons may be promoted to the rank of major.

The Veterinary Corps was established and becomes an integral part of the Medical Department. Appointments are made to the Veterinary Corps as assistant veterinarians with the rank of second lieutenant. After five years' service they are promoted to first lieutenant. The law provides that after 15 years veterinarians attain the rank of captain and after 20 years' service the rank of major.

A very important provision is made in the national defense act of 1916 for the assignment of not to exceed five officers of the Medical Department of the Army for duty with the military relief department of the National Red Cross, and also permits the erection of storehouses on military reservations for the use of the Red Cross and the use of Government buildings for the storage of their medical supplies.

Col. Jefferson R. Kean, Medical Corps, distinguished as a sanitarian and executive, becomes the first director general of military relief of the Red Cross, and has already utilized his extended experience to the very great advantage of both the Red Cross and the Army.

ARMY MEDICAL SCHOOL.

The Army Medical School, located at Washington, D. C., has had an unusually successful year.

Col. William H. Arthur, Medical Corps, is the present head of the school and has been its commandant since October, 1915. Associated under his direction, the staff of professors and assistant professors and special lecturers have given a valuable course of instruction to the student class, consisting of officers of the Medical Reserve Corps, who were candidates for appointment in the Medical Corps, medical officers of the Army and National Guard, and enlisted men of the Medical Department who were ordered to the school for special instruction.

The course has covered a wide range of subjects relating to medico-military science, the instruction being both theoretical and practical.

The laboratories of the school have produced all the vaccines used in the United States Army and in the National Guard, and have likewise furnished the antityphoid vaccine for the United States Navy.

The importance of this school to the military service can hardly be overestimated, and it is recommended that steps be taken looking to the securing by the Government of a suitable modern building specially designed for the Army Medical School. Heretofore its activities have been handicapped by crowded or imperfectly arranged rented buildings, and while the present quarters, recently occupied, are much better adapted to the purposes of the school than any of its former homes, yet they are far from ideal either in location or arrangement and leave much to be desired.

The Government should provide the Army Medical School with a permanent and modern home of its own.

LIBRARY OF THE SURGEON GENERAL.

It is desired at this time to call attention to the remarkable development during the past half century of this important adjunct of the Medical Department of the Army, and particularly to the great present need of a modern fireproof building for the proper housing of these valuable collections.

The Surgeon General's library began as a small collection of medical books in the office of Surg. Gen. Lovell in 1835, numbering about 228 volumes in 1840, and increased to about 587 in 1862.

The library in 1865 came first under the master hand of John Shaw Billings, and to this able medical officer and distinguished bibliographer must be given the greatest credit for several unique features in connection with its development. In 1889 the collection consisted of about 1,000 volumes. In 1895 it had grown, under the administration of Capt. Billings, to 300,000 portraits, books, and pamphlets. During this period the librarian conceived and promptly initiated the ingenious plan of a medical catalogue, indexed for author and subject, that should embrace not only monographs and standard works but the reports of individual cases upon which so many conclusions of medical science depend.

From this beginning has developed the universal catalogue of medical literature. The Index Catalogue, the first volume of which was issued in 1880 and consisted of 880 quarto pages. Since that date at least one such issue has been made annually by him and his able successors; Billings himself having edited the entire first 16 volumes, which ran through the alphabet.

This index, requiring great technical knowledge, infallible arrangement, and unceasing industry, has been kept fully up to date and to the latest professional advances, and, making its way over the earth wherever medical science is known, has brought great credit to the Army, fame to its designer and compilers, and has received the high commendation of the whole world—praise not given to mediocre work.

The present librarian, Lieut. Col. Champ C. McCulloch, jr., in his annual report to this office, makes certain recommendations which are concurred in.

The Surgeon General's library on June 30, 1916, contained 563,238 bound volumes, theses, journals, transactions, unbound volumes and pamphlets, constituting the largest collection of medical literature in the world.

ARMY MEDICAL MUSEUM.

The Army Medical Museum was begun under the direction of Surg. Gen. William A. Hammond, United States Army, in 1862. It began very modestly, as all the great collections have, but with the passing years and under the skilled direction of many capable and devoted hands, it has grown into one of the largest, most instructive, and valuable museums in existence.

It consists now of approximately 47,000 specimens: Pathological, anatomical, comparative anatomy, microscopical, and miscellaneous, and about 15,000 photographs and negatives. About 8,000 specimens have been donated or exchanged with other instititions.

MEDICO-MILITARY OBSERVERS OF EUROPEAN WAR.

The Medical Department has had six representatives with th armies of the countries now at war. These officers of the Medica Corps are Lieut. Col. Alfred E. Bradley, Majors Joseph H. Ford James Robb Church, Clyde S. Ford, and William J. L. Lyster, an Capt. Perry L. Boyer.

Maj. Joseph H. Ford spent approximately 13 months with th Austro-Hungarian armies on the eastern front, his detail extendin from September 26, 1914, to October, 1915. His reports received i this office have covered a wide range and are most comprehensive an valuable.

Maj. James Robb Church, who has been present with the Frenc Army on the western front since January 28, 1916, has already fo warded much information of value in his reports on the medic military conditions coming under his notice.

Col. Bradley, Maj. Clyde S. Ford, and Maj. William J. L. Lyst were officially detailed by the War Department as observers wit the British forces in May, 1916, and are now actively engaged wit their duties in the field. Their arrival in Europe was opportun and the information received indicates that their observations will b of great interest and value professionally and scientifically.

Maj. Perry L. Boyer was in London, England, at the outbreak of the war and departed therefrom September 10, 1914, en route to Paris, France, as an observer with the French armies, being on duty in France until November 25, 1914, when he returned to the United States.

The reports made by the members of the Medical Corps detailed as observers in Europe are of such a character as to warrant, at the proper time, their presentation in an extended form for the information not only of the medical and military student, but for the interest they will have for the general reader.

ARMY NURSE CORPS.

The reports of the work of the Army Nurse Corps have been most gratifying, and a much-needed increase has been authorized for the coming fiscal year. Great care is exercised in the selection of its personnel, with the result that most satisfactory work is being done.

The mobilization of the regular troops and militia having resulted in the establishment of many hospitals on the border, the appointment of 276 nurses was authorized to meet the emergency. At this time there are on duty at the border hospitals:

Base hospitals:	
Fort Sam Houston, Tex	[1] 54
Fort Bliss, Tex	26
Brownsville, Tex	20
Eagle Pass, Tex	24
Nogales, Ariz	16
Camp hospitals:	
Deming, N. Mex	10
Laredo, Tex	10
Douglas, Ariz	10
McAllen, Tex	12
Total	182

Nurses have been and are being appointed in the regular corps as rapidly as possible to meet the need, and their numbers have been further augmented by the assignment to active duty of a large number from the reserve list, the enrolled nurses of the American Red Cross constituting this reserve.

HOSPITAL TRAIN.

A hospital train, designed in the office of the Surgeon General and consisting of 10 Pullman cars built in the Pullman car shops at Chicago, has been prepared to meet the needs of the Medical Department and is now in operation. Five of the cars are stripped of berths and regular hospital beds have been installed; two large side doors for loading and unloading stretcher cases are provided; two of the cars are regulation sleepers and equipped with extra fans, call bells, medicine cabinets, linen cabinets, extra water and ice tanks, etc., installed for ambulant cases. One car has a complete operating room. The kitchen car is complete and so designed that it can care for over 200 sick.

---

[1] Includes 7 for assignment to duty on the hospital train.

In addition to the Regular Army personnel there will be nurses from the Army Nurse Corps to act as ward nurses in certain cars, diet nurses, and two are to be assigned to the operating car.

The train is painted maroon, with the insignia of the Army Medical Department, and with the train number and car number on each car.

This train will operate between the Mexican border, the west coast, Hot Springs, and the East. Such additional trains as may be necessary to meet the needs of the service will be provided, including a completely equipped bath and disinfecting train for use, if needed, on the border in connection with any possible appearance of typhus fever among troops.

EXPEDITION INTO MEXICO.

In March, 1916, an expeditionary force, consisting of United States troops of all branches, crossed the Rio Grande and entered northern Mexico. This force during most of the time has consisted of from 8,000 to 12,000 men (a monthly average of about 10,000). During an experience covering several months of arduous service under the most trying climatic and insanitary conditions this 10,000 has maintained a remarkable record of health and efficiency.

Its noneffective rates compare favorably with the best of the home troops under garrison conditions. The work of the medical officers and the sanitary personnel has been the subject of special commendatory reports by the commanding general of the expedition.

MOBILIZATION OF THE NATIONAL GUARD.

Under the provisions of the national-defense act of June 3, 1916, the State troops of the country were called into the Federal service in June, 1916, by an order of the President.

The National Guard of the United States, comprising a force consisting of approximately 135,000 officers and enlisted men of various branches, was rapidly mobilized in their respective State camps Here they were subjected to a rigid physical examination, when tim allowed, conforming to that required in the regular service; inspected mustered, and equipped under the direct supervision of officers o the United States Army specially detailed for that duty. As rapidl as possible these soldiers from civil life were transferred to the larg concentration and training camps in the Southern Department an stationed in close proximity to the troops of the Regular Army some 40,000 of which had been occupying the border district adjacen to the Rio Grande for several years. This sudden and rapid movement of a large body of partially trained or quite inexperience troops threw an enormous amount of work and responsibility o those charged with its execution, and particularly upon the staff an supply departments of the Army.

To the officers of the Medical Corps of the Army was given th task of making the physical examinations and administering the vaccination against typhoid fever and smallpox, immediately compu sory on entering the Federal service under the existing regulation Their assignment to the different camps as sanitary inspectors an instructors added further to their important duties.

It can be fairly stated that this mobilization has been accomplishe with promptness and with the minimum of disease and discomfor

In view of the general situation and the suddenness of the call there is little ground for complaint of any kind, and particularly from the standpoint of hygiene and sanitation. A comparison with a somewhat similar mobilization of citizen soldiers in the summer of 1898 and its results shows clearly the advance that has been made in the knowledge of preventive medicine and camp sanitation in the Army since the days of the Spanish-American War.

From the weekly telegraphic reports of "sick and wounded" for the combined forces on the southern border the sick rate since mobilization has been less than 2 per cent, which, expressed in terms of noneffectiveness, is equivalent to a rate of 18.13 per thousand.

The mobilization of the National Guard in 1916 offered a unique and valuable opportunity for instruction to the members of both the National Guard and the Regular Army. The medical officers of both branches have rendered excellent service, and the exceptionally low sick rates that have prevailed during the first few months in the combined camps of the border speak in the highest praise of their ability and efficiency.

HEALTH OF THE ARMY.

INTERNATIONAL NOMENCLATURE.

The diagnostic terms for diseases and injuries, adopted by the Medical Department in accordance with the International Nomenclature, are used with the international numbers for the fourth year in this report.

The International Nomenclature is used by most of the important foreign countries. It is also used by the Census Bureau in this country and by an increasing number of boards of health and large hospitals.

In studying statistics for other countries where the terms used are expressed in a foreign language, the international number furnishes a ready key for their interpretation.

Following Table No. 81 will be found the 10 tables giving the military statistics for the year 1915, as agreed upon at the International Commission for the Unification of the Medical Statistics of Armies, held at Budapest in 1894, at Madrid in 1903, and modified by the last meeting held at Berlin in 1907. The diagnostic terms and numbers used in these tables are those agreed upon by the commission, and are not to be confused with the terms and numbers of the international nomenclature used in the remainder of this report and based upon the second decennial revision by the international commission held in Paris, July 1 to 3, 1909.

As in 1912, 1913, and 1914, only original admissions are used in compiling the statistics in this report. In the years 1904 to 1911, inclusive (reports 1905–1912), the readmissions were counted as admissions. In this report in making comparisons between cases and admissions, the terms case admission (reports 1913–1916, inclusive, and prior to the one for 1905) and total admission (reports 1905–1912, inclusive), will be used.

ADMISSION RATES.

Table No. 81 shows the total admission and case admission rates for American troops of the Army, for the United States, continental (exclusive of Alaska), and for American troops in the Philippine Islands, for diseases, external causes, and all causes separately for each year 1904 to 1911, inclusive.

Table No. 68½ gives the rates per 1,000 for the entire Army. So much interest has been shown concerning the incidence of certain diseases, especially tuberculosis, typhoid fever, and venereal diseases, for the entire Army—that is, for all officers and enlisted men, both American and native troops—that it was deemed advisable to publish this data to include all troops together. The rates for American troops, enlisted men, placed in comparison for ready reference, may be found in Tables Nos. 69 and 76.

OFFICERS.

The mean strength of officers was 4,394, as obtained from the reports of sick and wounded of the Medical Department, and 4,873, from the office of The Adjutant General. There were 2,430 admissions, 18 deaths, and 103.58 constantly noneffective from all causes, equal to ratios of 553.03, 3.69, and 23.57 as compared with ratios of 495.76, 4.76, and 23.12 per 1,000 for the year 1914. The constantly noneffective rate was higher than for 1914; the admission also was higher.

The chief causes of admission and their rates were: Influenza, 60.54; bronchitis, 42.33; diarrhea and enteritis, 39.14; diseases of the pharynx, 31.63; diseases of the nasal fossae, 29.59, and dengue, 20.94.

OFFICERS RETIRED.

Eighteen officers were retired on account of disability during the year, making a rate for retirement for disability of 3.69 per 1,000 as compared with 6.22 per 1,000 for 1914. The discharge rate for disability in enlisted men (all) was 14.06, as compared with 12.78 per 1,000 for 1914.

The following table shows the principal causes for which retirements were made and the rank and age of the officers retired:

TABLE NO. 1.—*Retirement of officers, United States Army, year 1915, for disability, by causes and rank, grouped by ages.*

ENLISTED MEN.

The mean enlisted strength of the Army, American troops, white and colored, for the year 1915, as reported on the monthly sick reports of the Medical Department, was 93,262, and on the returns of The Adjutant General's Office, 94,729. The former represents the strength of the commands from which the sick returns were made and was used in calculating all ratios except those for deaths and discharges. As all deaths and discharges were reported, even of those absent from a command, the total strength as obtained from The Adjutant General was used in calculating ratios pertaining to those headings. There was an increase in strength over the year 1914, for which the medical returns showed 87,228 and The Adjutant General's Office, 88,133.

During the year 1915 American troops were stationed in the United States proper, the Philippine Islands, China, Alaska, Hawaii, and the Canal Zone. Native troops served in Porto Rico and the Philippine Islands. Statistics for the native troops, Porto Ricans and the Philippine Scouts, have been separately compiled, and when reference is made to the "Army" in this report the entire Army—officers, white, colored, and native enlisted men—is meant.

The size of garrisons in the Tropics, which constituted such a large percentage of our military forces, renders of more importance than formerly the general rates for the entire Army.

Charts A, B, C, D, E, F, and G are for the entire Army for the decade 1906–1915. For years prior to 1906 the same data as shown in these charts will be found published in the report for 1912, pages 14, 15, and 16.

Table No. 76 gives American troops, enlisted men by countries, placed in comparison for 1915.

The admission and noneffective rates for the entire Army and for the troops in geographical divisions are readily comparable in the following tabulation:

Admission and noneffective rates for entire Army and for troops in geographical divisions for years 1915 and 1914.

	Army (entire).	American troops of the Army (enlisted men).	Enlisted men serving in geographical divisions.							
			United States (at home).	Alaska.	Canal Zone.	Hawaii.	Philippine Islands.		China.	Porto Rico.
							American troops.	Native troops.		
Admission rates:										
1915	726.19	744.59	704.01	386.63	871.00	568.94	990.45	573.84	1,462.17	555.07
1914	660.45	665.83	629.84	422.95	955.22	523.27	877.69	714.14	1,080.23	629.30
Noneffective rates:										
1915	25.22	25.88	25.74	8.91	26.00	20.44	29.15	15.68	35.00	22.78
1914	23.78	24.02	23.37	10.52	37.30	18.75	30.58	20.30	29.68	22.52

The rates are slightly higher this year for the United States, Hawaii, China, and for the American troops in the Philippine Islands. A decided reduction in admission and noneffective rates occurred in Alaska, Canal Zone, and the Philippine Islands (native troops). The most marked reduction is noted in the admission rate for the Philippine Scouts and in the noneffective rate for the troops serving in Canal Zone.

ADMISSIONS TO SICK REPORT (AMERICAN TROOPS, ENLISTED MEN).

[See Tables Nos. 69 and 76.]

The admissions to sick report during the year 1915 show a slight increase, being 744.59 as compared with 665.83 in 1914. The admission rate for disease only is 610.32; in 1914 it was 539.46. Table No. 81 shows the case admission and total admission rates for all American troops, those in the United States and those in the Philippine Islands, 1904 to 1911, inclusive. The diseases causing the highest admission rates were: Venereal, 107.71; diseases of the pharynx, 65.10; bronchitis, 35.17; influenza, 34.27; and diarrhea and enteritis, 31.51. The rates just given are for the American enlisted men of the Army and are given first for convenience of comparison. For the entire Army (all officers and enlisted men, including native troops) the rate is 726.19. For disease only the rate is 597.02. The rate for disease this year is slightly higher both among the American troops and for the entire Army. This is probably accounted for by the increased rates for venereal diseases.

For venereal diseases the rate for white troops was 105.81, a decrease over 1914; for colored, 136.30, which was slightly higher than for 1914. The rates in the Philippines for these troops were 177.08 and 258.76, respectively, which are higher for both races over the rates of 1914 in the Philippines, 174.79 and 233.76, respectively. These high rates are undoubtedly due to social conditions and indicate the necessity for a change of conditions before rates comparable to those obtaining in the United States may be expected. As the rate for 1912 for colored troops in the Philippines was 524.06, the highest recorded in the Army, the present rate is an index of the effectiveness of the measures instituted for improvement in this condition.

The case admission rate for external causes, American troops, enlisted men, was 134.27. In 1914 this rate was 126.37, and in 1913, 136.52. The principal causes for this rate were: Traumatism by fall, 36.16; injuries by animals, 12.33; traumatism by cutting or other piercing instruments, 10.57; traumatism by crushing, 6.66; burns, 4.12; and poisoning by food, 3.44.

NONEFFECTIVE RATES.

Chart B shows for the entire Army the constantly noneffective rate for all causes from the year 1906 to 1915, inclusive. This rate is the true measure of nonefficiency of the Army from sickness and injury. The rate for disease and injury obtained for the total American troops, enlisted men, for the year 1915 was 25.88, as compared with 24.02 for 1914 and 24.33 per 1,000 in 1913. The rate for 1914 is the lowest recorded noneffective rate in the history of the Army. The highest noneffective rate on record was for the year 1898, when the total rate was 82.83 per 1,000, and the rate for diseases alone was 69.09.

The noneffective rate for all troops in the military service, or the entire Army, from all causes, was 25.22 (for disease alone, 20.85), which is slightly higher than that for 1914, but still much below the rates for any preceding year, except 1914, when the rate was 23.78. This rate during the past decade shows a steady reduction. In 1906 the noneffective rate was 47.86.

DISCHARGES FOR DISABILITY.

Chart D gives the rates for discharges for disability for the Army from the year 1906 to 1915, inclusive.

Soldiers stationed outside of the territorial limits of the United States are brought to the United States for discharge, except those belonging to the Porto Rican Regiment and the Philippine Scouts. They are, however, credited in the tabulated reports to the country in which the soldiers were serving when they became disabled, if their commands were there at date of discharge.

The present system requires that all soldiers certified by medical officers to be permanently incapacitated for the military service shall be critically examined by a board of two medical officers before being

Chart A.—Army- Officers and American and native troops.

Chart B.—Army. Officers and American and native troops.

[Noneffective rates, all causes, years 1906-1915.]

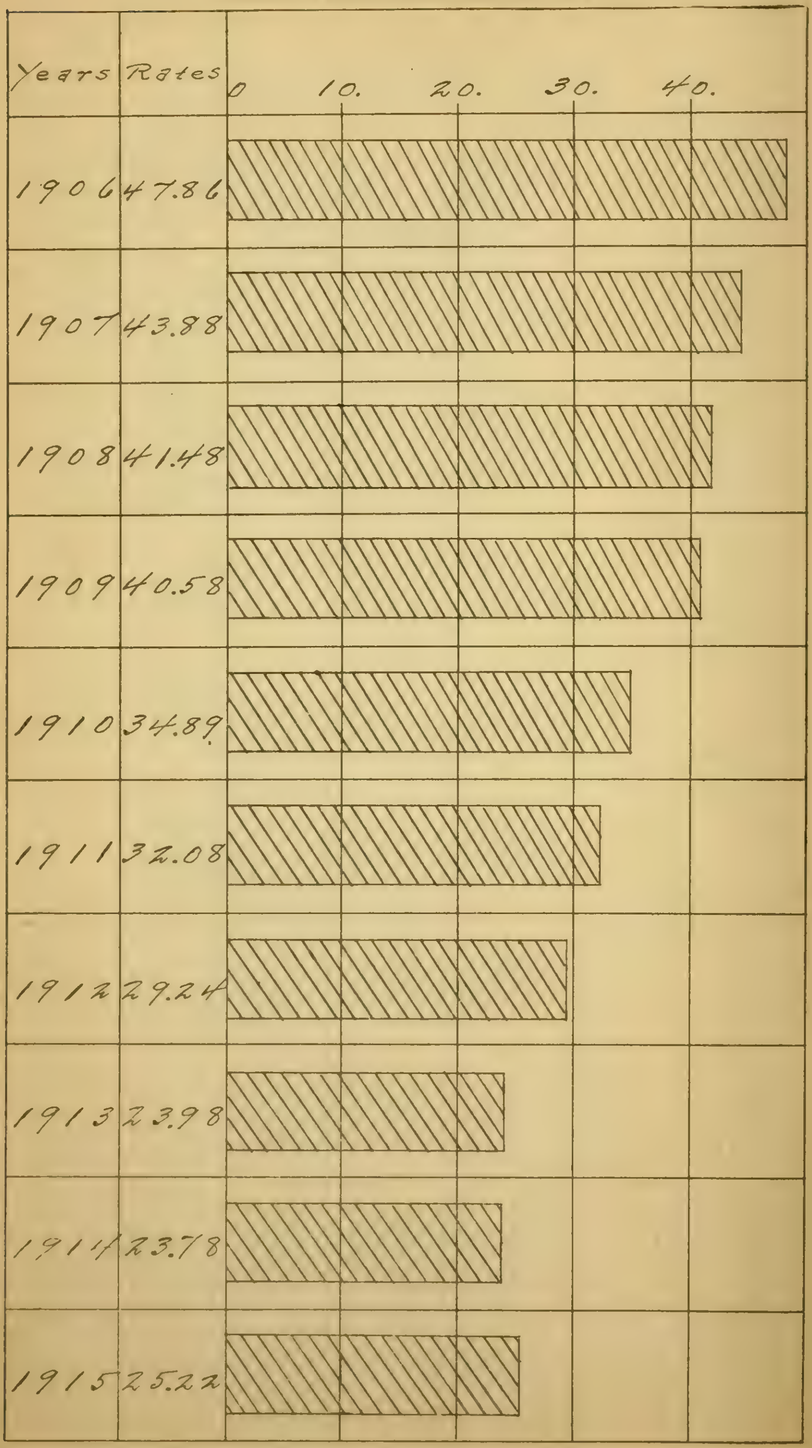

Chart C.—Army. Officers and American and native troops.

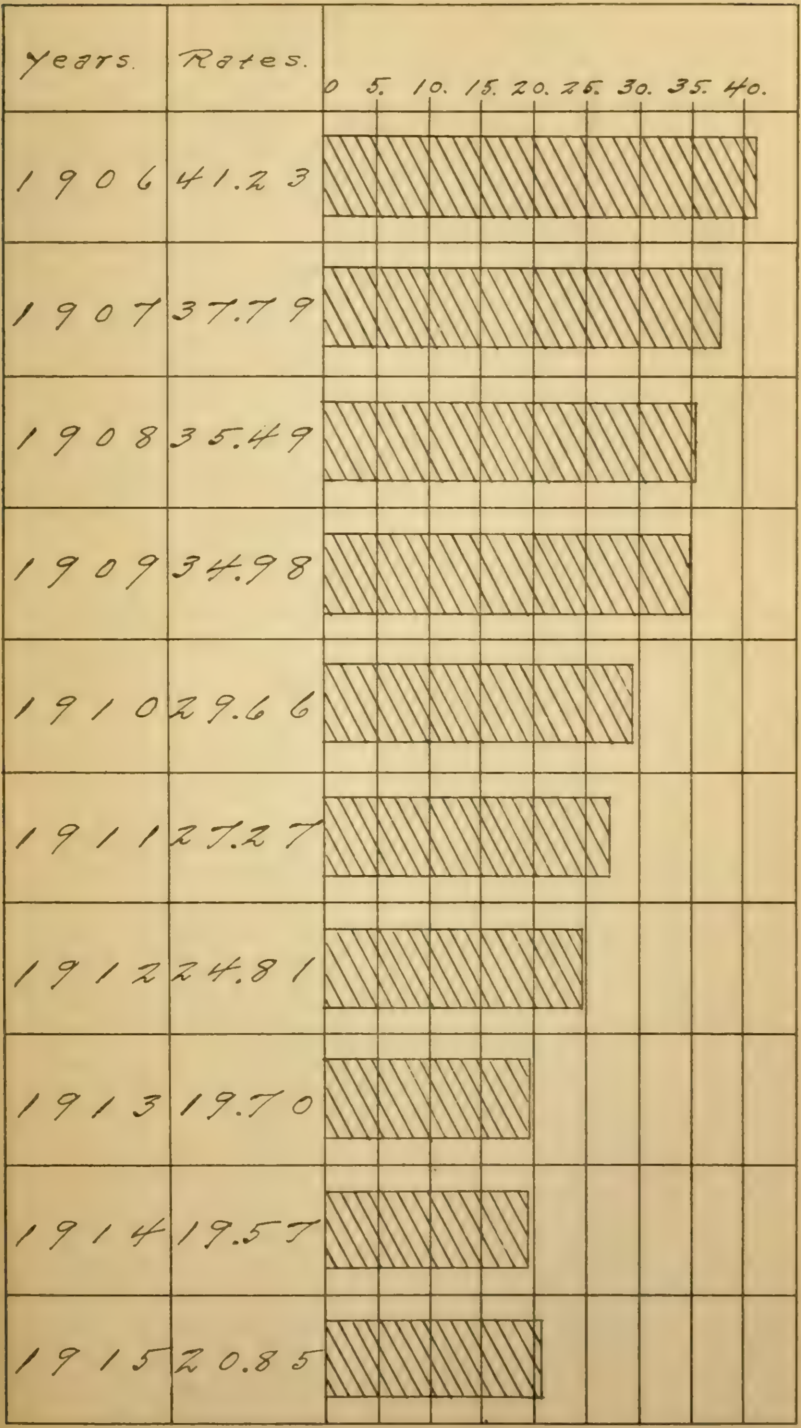
[Noneffective rates for disease, years 1906–1915.]



Years.	Rates.
1906	41.23
1907	37.79
1908	35.49
1909	34.98
1910	29.66
1911	27.27
1912	24.81
1913	19.70
1914	19.57
1915	20.85

discharged. The reports of these boards go to the department headquarters from where discharges are ordered, except in the cases of soldiers at a recruit depot or general hospital, and the reports of boards on insane patients. In the latter circumstances the reports are sent to the Adjutant General of the Army, who directs the discharge or issues the order when insane are recommended to be transferred to the Government Hospital for the Insane, Washington, D. C.

The discharge rate for 1914 was lower than for any year since the Spanish-American War, being 12.99 as compared with 14.26 for the year 1915. In 1915 there were in the Army 1,351 men, American troops, discharged for disability, as compared with 1,145 during 1914. The corresponding rate for 1913 was 13.24. The rate for 1867 was 13 per 1,000, and the lowest rate from 1894–1898, inclusive, was that for 1895, the lowest on record in the Army, 9.15 per 1,000. The highest rate in any year for discharge for disability was in 1849, when the total rate for discharge was 76.7 per 1,000. The rate for the entire Army was 14.06 per 1,000.

The discharge rate for disease in 1915 (American troops) was 12.79 per 1,000, as compared with 11.39 in 1914, and that for external causes was 1.47 in 1915 as compared with 1.60 in 1914. The diseases causing the highest discharge rate in 1915 were as follows, absolute numbers and rates per 1,000 being given:

Discharges, enlisted men (American troops), year 1915.

Disease.	Number.	Ratio.
Mental alienation	313	3.30
Tuberculosis (all)	170	1.79
Flat foot	118	1.25
Venereal disease	78	.82
Epilepsy	65	.69
Organic heart disease	47	.50

DEATHS FROM ALL CAUSES.

Chart E shows the total death rate for all causes for the Army from the year 1906 to 1915, inclusive. (See also Table 3A.)

For American troops, enlisted, the total rate for 1915 was 4.60 as compared with the corresponding rate of 4.45 for 1914 and 4.86 for 1913. The rate for 1915 is but little above the rate for 1914, which was the lowest on record in the Army. The highest death rate occurring in any year was in 1849, when the total rate for deaths was 80.2. The death rate for diseases was 2.60 in 1915: 2.36 in 1914, and 2.57 in 1913. The total number of deaths in 1915 was 436. The following diseases caused the highest number of deaths, absolute numbers and rates per 1,000 being given:

Deaths, enlisted men (American troops), year 1915.

Disease.	Number.	Ratio.
Tuberculosis	31	0.33
Pneumonia (lobar)	29	.31
Organic heart disease	22	.23
Measles	22	.23
Appendicitis	12	.13
Epidemic cerebrospinal meningitis	10	.11

The following were the principal causes of deaths, among officers and enlisted men, American troops, from external causes, with the number in each instance: Suicides, 53; homicides, 21; drowning, accidental, 34; traumatism by fall, 9; traumatism by other crushing, 29; traumatism by firearms, 12.

INFLUENCE OF STATION ON TROOPS.

Regarding the comparative healthfulness of the various countries in which American troops were serving during the year (Army transports being excluded), it will be noted that Alaska maintains the lowest admission and noneffective rates, 386.63 and 8.91 per 1,000, respectively; the Canal Zone the lowest death rate, 2.37 per 1,000; China had the lowest discharge rate, 9.74; China also had the highest noneffective rate, 35.00, as well as the highest admission rate, 1,462.17 per 1,000; the Philippine Islands the highest discharge rate, and the United States the highest death rate.

INFLUENCE OF ARMS OF SERVICE.

The admission rate for disease was highest for the Field Artillery, being 764.57, while the Ordnance Corps had the lowest, 426.21 per 1,000.

The death rate was highest in the Ordnance Corps, 6.78, and lowest in the Field Artillery, 1.79; the Hospital Corps being next with 2.02 per 1,000.

TABLE NO. 4.—*Influence of disease on enlisted American troops of the Army, by arms of service, for the year 1915.*

Chart I.—United States and Philippine Islands. Officers and American and native troops.

[Noneffective rates for special diseases, year 1915.]

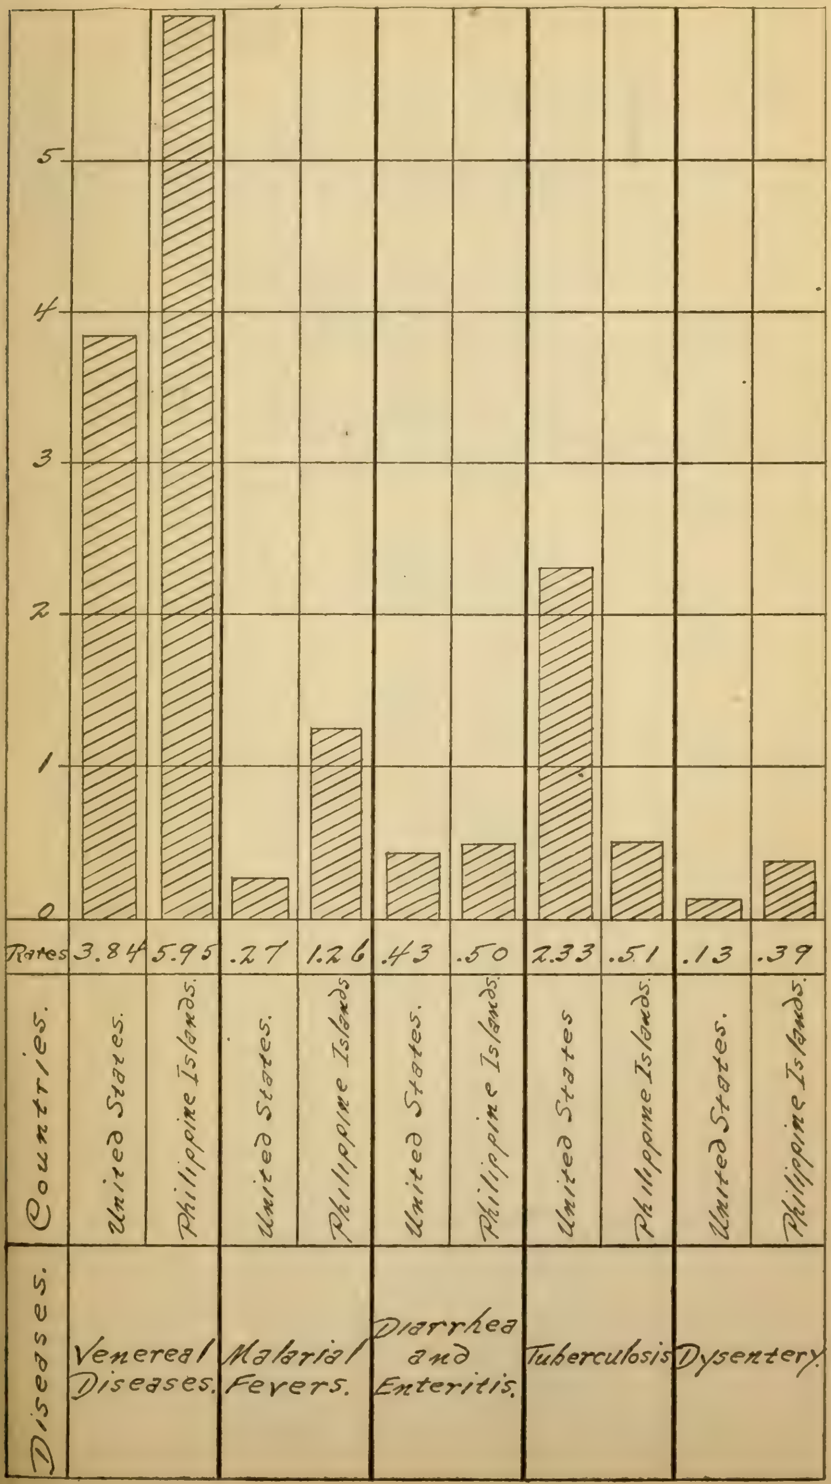

Chart I¹.—Army. Officers and American and native troops.

[Admission rates for malarial fevers, years 1906–1915.]

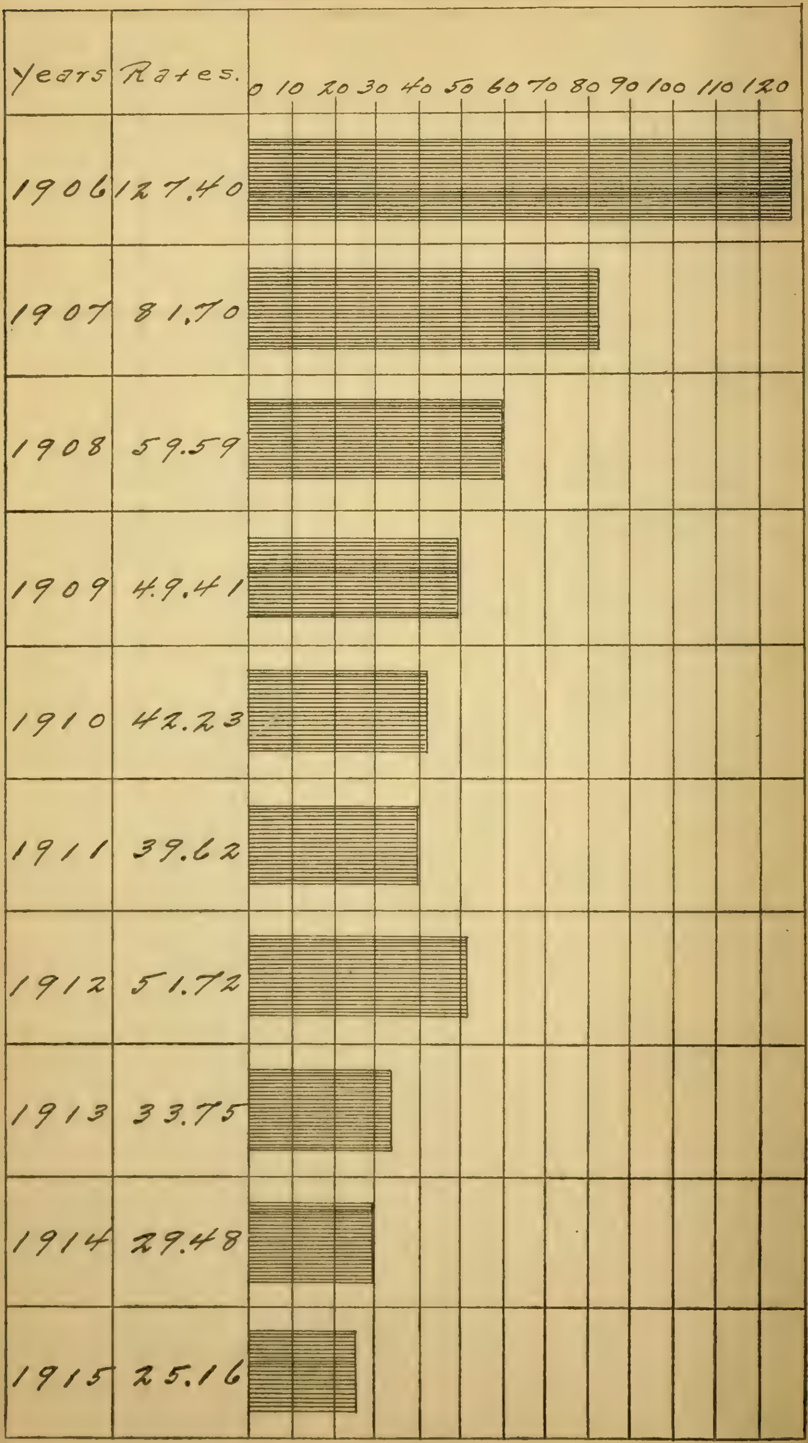

Chart K.—Army. Officers and American and native troops.

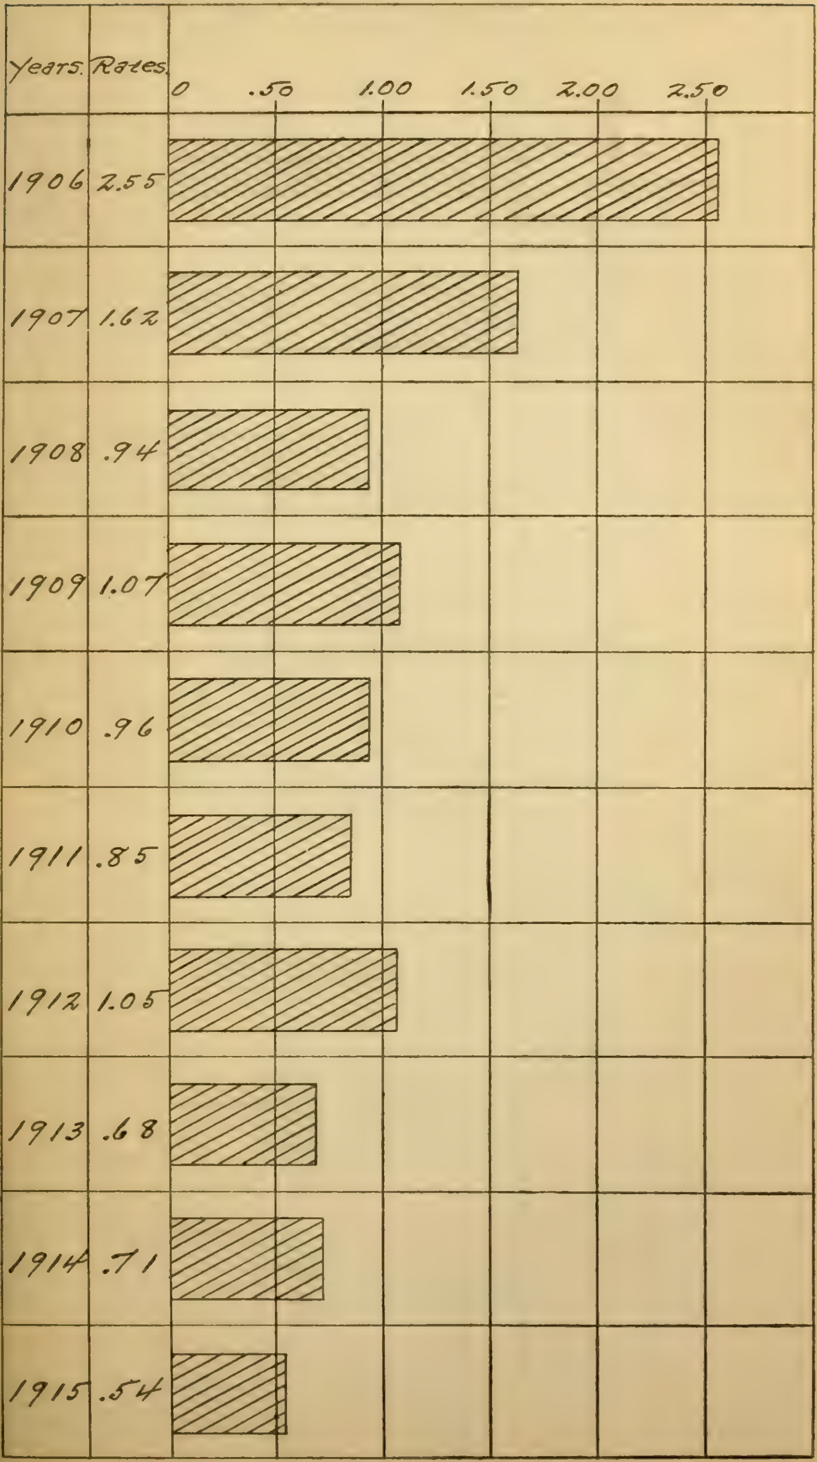
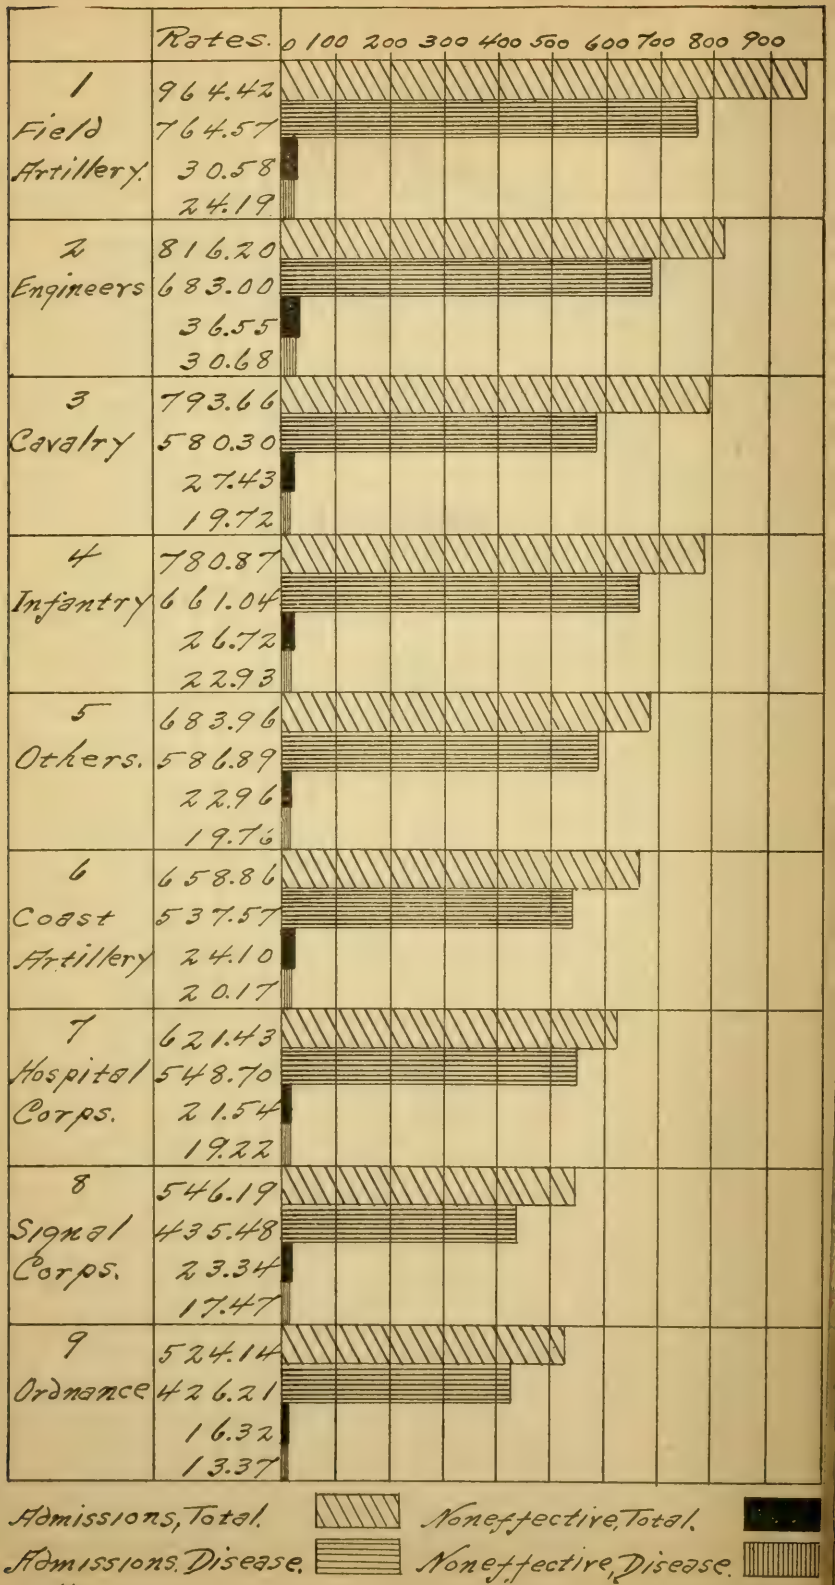
[Noneffective rates for malarial fevers, years 1906–1915.]



[Admission and noneffective rates, all causes and disease, by arms of service, year 1915.]



The following tabulation exhibits the admission and noneffective rates for the different races for the principal diseases causing the greatest nonefficiency:

Diseases causing the greatest amount of nonefficiency in the Army, arranged in accordance therewith, together with their admission rates, in ratios per 1,000 of mean strength.

	Army, total enlisted.		White.		Colored.		Porto Ricans.		Philippine Scouts.	
	Noneffective rates.	Admission rates.	Noneffective rates.	Admission rates.	Noneffective rates.	Admission rates.	Noneffective rates.	Admission rates.	Noneffective rates.	Admission rates.
Venereal diseases	4.62	103.52	4.68	105.81	6.25	136.30	4.82	89.57	1.96	34.33
Tuberculosis	1.72	3.56	1.74	3.44	2.69	4.65	.19	1.47	.58	4.54
Mental alienation	.85	3.74	.89	3.88	1.04	3.27	.28	1.47	.16	2.36
Bronchitis	.62	34.56	.63	35.06	.65	36.87	....	....	.48	28.52
Tonsillitis, acute follicular	.59	42.44	.67	46.48	.34	23.60	.06	2.94	.05	3.09
Appendicitis	.59	8.24	.63	8.84	.65	7.24	....	....	.03	.73
Malaria	.54	25.74	.50	23.60	.17	8.44	.35	8.81	1.54	80.11
Mumps	.46	9.80	.47	10.30	.54	9.82	....	....	.17	3.09
Influenza	.44	32.25	.47	35.06	.31	22.40	.10	2.94	.04	1.63
Diarrhea and enteritis	.41	31.76	.42	31.87	.29	26.19	.23	17.62	.45	37.60
Measles	.40	6.45	.45	7.22	.01	.34	....	....	.07	1.45
Articular rheumatism, acute and chronic	.38	5.52	.41	5.92	.28	4.13	.41	4.41	.03	.54
Hernia	.36	3.59	.38	3.89	.26	2.24	....	....	.08	.73

It will be seen from the above tabulation that the white troops have next to the highest rate for venereal diseases, 105.81 per 1,000; the colored troops the highest, with 136.30, while the native troops (Porto Ricans and Philippine Scouts) had the lowest rate, 89.57 and 34.33, respectively.

INFLUENCE OF RACE.

[See Tables 67 and 75]

Table No. 67 shows that the white troops had the highest admission rate, while the colored troops have the highest death, discharge, and noneffective rates. Porto Rico had the lowest admission and discharge rate, and the Philippine Scouts the lowest death and noneffective rates. The admission rates were: White troops, 745.17; colored, 735.87; Philippine Scouts, 573.84; and Porto Ricans, 555.07.

The constantly noneffective rates were: Colored, 28.46; white, 25.70; Porto Ricans, 22.78; and Philippine Scouts, 15.68 per 1,000.

The discharge rates were: Colored, 15.85; white, 14.16; Philippine Scouts, 11.44; and the Porto Ricans, 7.34 per 1,000.

The death rates were: Colored, 5.51; white, 4.54; Porto Ricans, 4.41; and the Philippine Scouts, 2.54 per 1,000.

The rates for total losses were: Colored, 21.36; white, 18.70; Philippine Scouts, 13.98; and Porto Rican troops, 13.45 per 1,000.

The average number of days lost for each case treated was: Porto Ricans, 14.98; colored, 14.12; white, 12.59; and Philippine Scouts, 9.97 per 1,000.

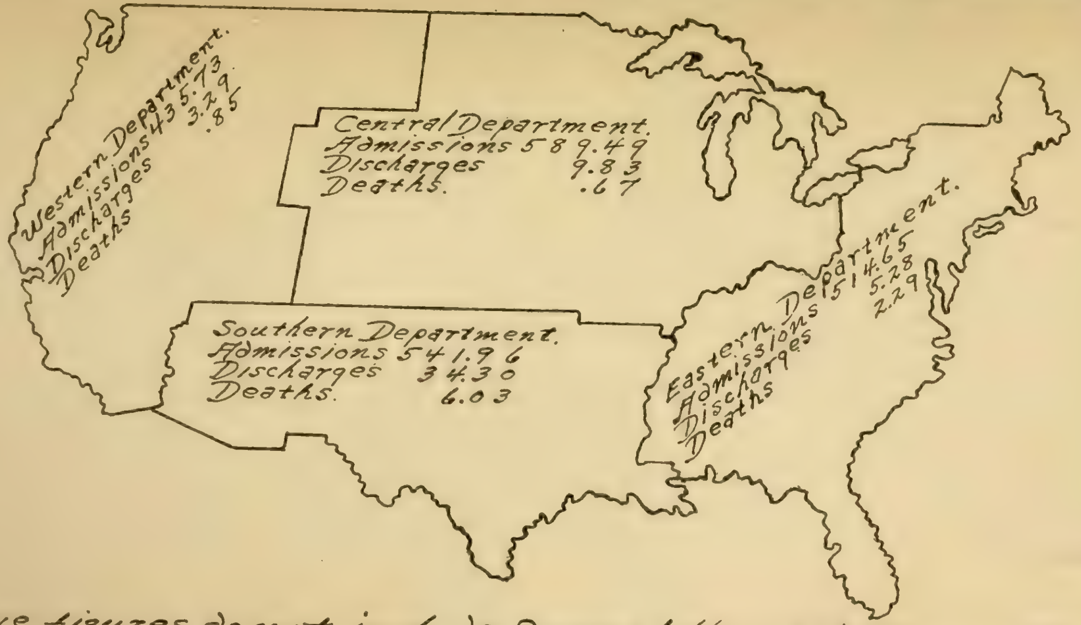
COMPARISON WITH FOREIGN ARMIES.

As in previous years it has been customary to make an effort to compare the health conditions in the United States with the same conditions in the armies of Great Britain, the continental powers, and Japan. Owing to the unusual conditions which have existed throughout the calendar year 1915 in Europe, no effort at comparison is made in this report.

SURGICAL OPERATIONS.

Table No. 66 shows the principal surgical operations performed by medical officers upon the personnel of the Army. Operations upon families of officers and enlisted men and other civilians who are entitled to treatment at Army hospitals at the various posts are not included. During the year 1915 there were 6,323 operations performed, of which 6,244 were successful, 36 partially successful, and 15 failures; 28 deaths resulted. Of the anesthetics used, ether was more prominent, being used in 2,459 cases, chloroform in 135, local anesthesia in 2,865, chloroform and ether or gas in 63, and other general anesthetics in 7 cases. Six hundred and eleven appendectomies were performed, of which 15 were gangrenous, 6 resulting in death; 289 herniotomies and 14 operations for goiter.

Military Departments, United States, continental {excluding Alaska} showing the relative Admission, Discharge, and Death rates for Disease, Officers and enlisted men, year, 1915.



Note: Above figures do not include General Hospitals, Recruit Depots, Independent Stations, and Infantry and Cavalry Divisions on the Mexican Border.

UNITED STATES (CONTINENTAL) EXCLUSIVE OF ALASKA.

ADMISSION RATE.

Cases only are counted; readmissions for the same illness are omitted in counting cases. Table No. 81 shows case admissions and total admissions for enlisted American troops of the Army for the United States and American troops, Philippine Islands, 1904 to 1911, inclusive.

Year.	Case admission rate.			Noneffective rate, all causes.	Highest noneffective rate for disease.	
	All causes.	For disease.	External causes.		Venereal.	Tuberculosis.
1915	704.01	564.49	139.52	25.74	3.99	2.33
1914	629.84	498.83	131.01	23.37	3.75	2.23
1913	619.90	487.94	131.96	22.94	3.58	2.34
1912	738.70	596.94	141.76	27.15	5.96	1.65
1911	837.00	680.00	157.00	31.40	8.82	1.63
1910	840.00	662.00	178.00	33.95	10.14	1.87

The admission rate for 1915, 704.01, is slightly higher than for the preceding year; this rate is compared with the rate for five years preceding in the total above. The noneffective is lower than the average for preceding five years.

DISCHARGES FOR DISABILITY.

The disability discharge rate for the United States for 1915 was 13.60 per 1,000, as compared with 14.82 for 1914, 13.45 for 1913, 14.48 for 1912, 15 for 1911 and 15.28 for 1910. It will be noted that the rate is considerably lower than for 1914.

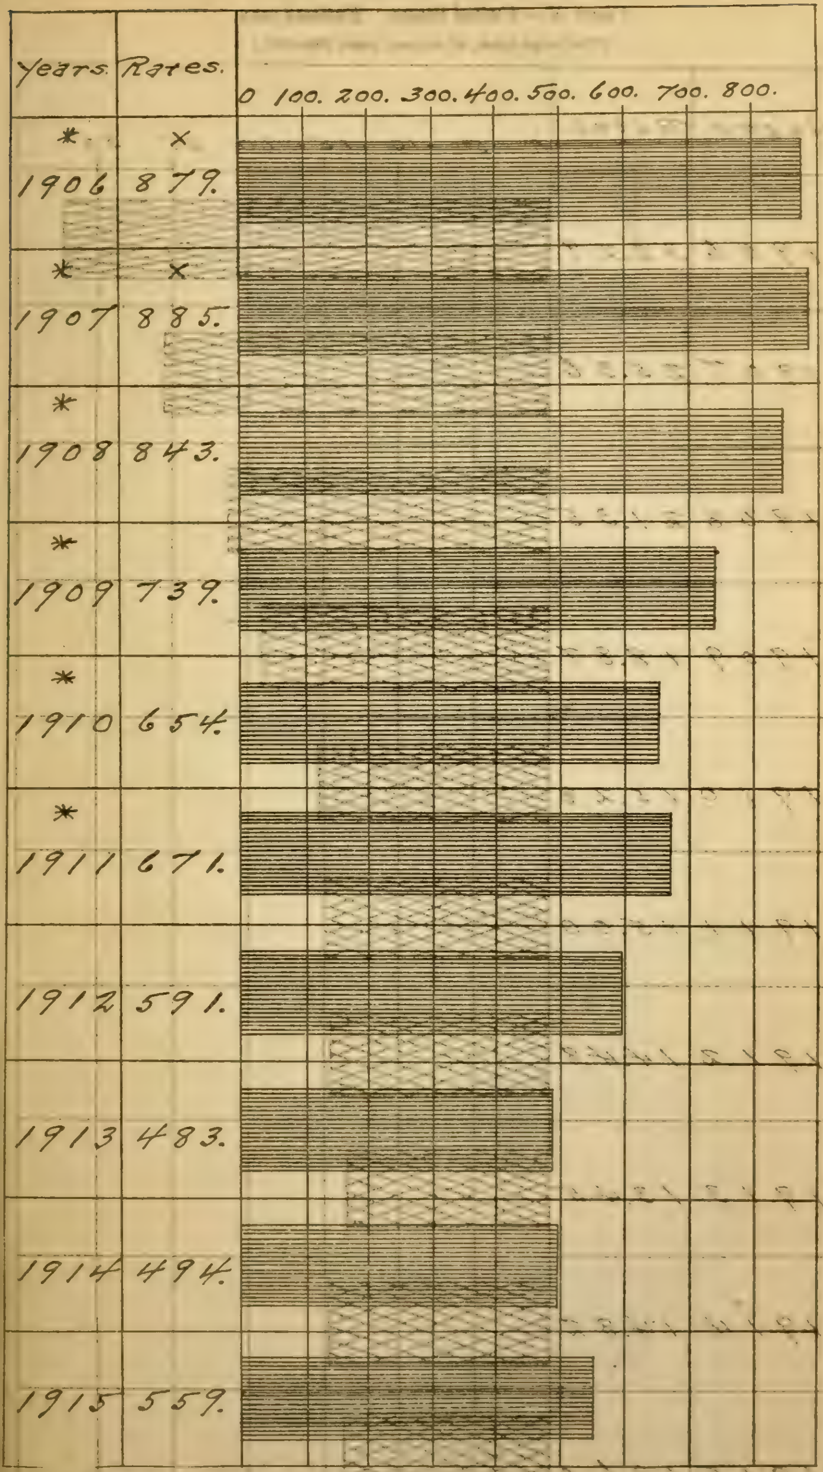
Chart M.—United States. Officers and men.

[Admission rates for disease, years 1906–1915.]



* Excess of cases deducted to correspond with years preceding 1906 and 1912 to 1915.
× Enlisted men, officers not included.

Chart N.—United States. Enlisted men.

[Discharge rates, all causes, years 1906–1915.]

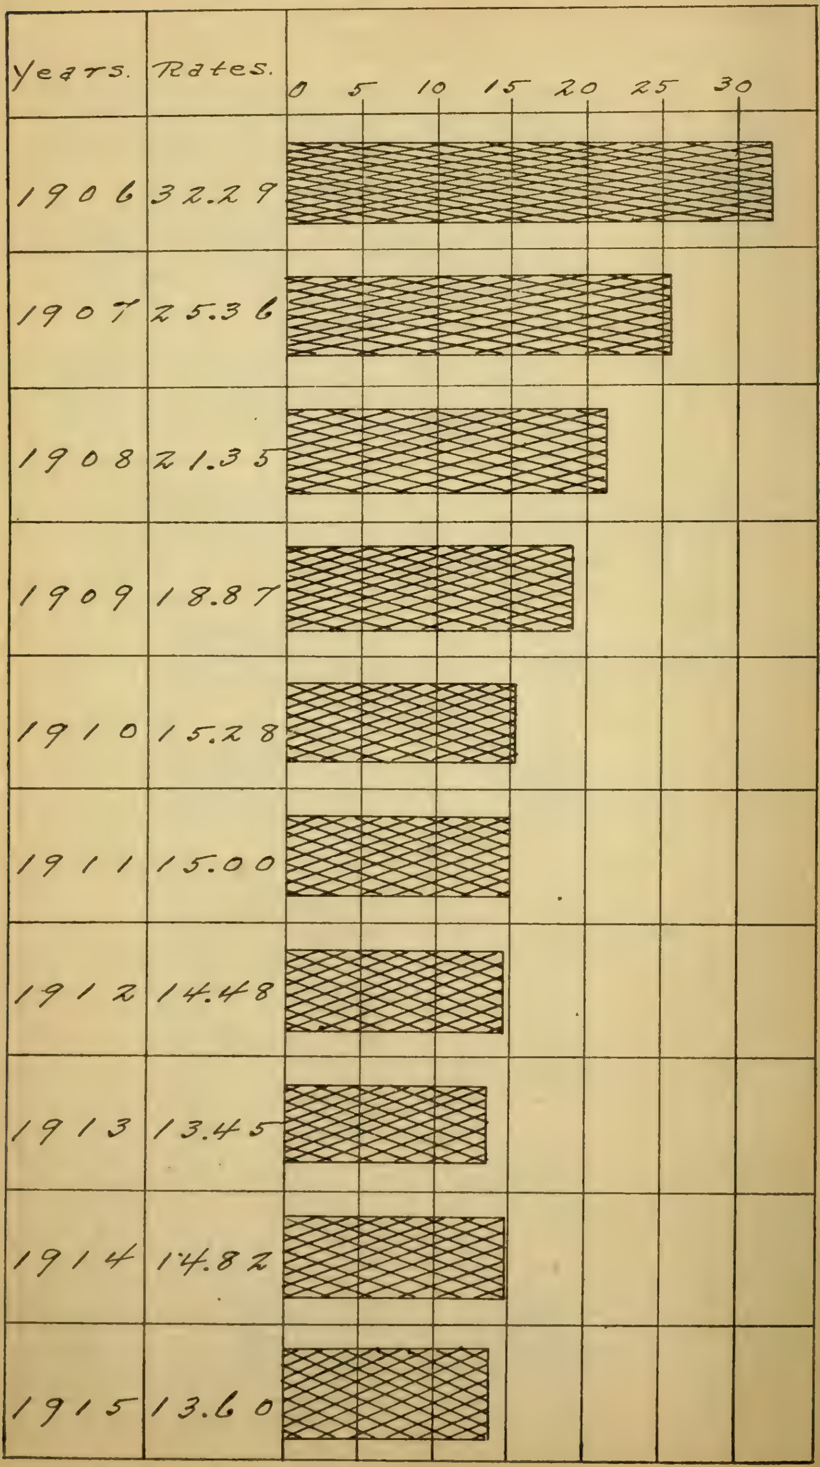


Chart O.—United States. Enlisted men.

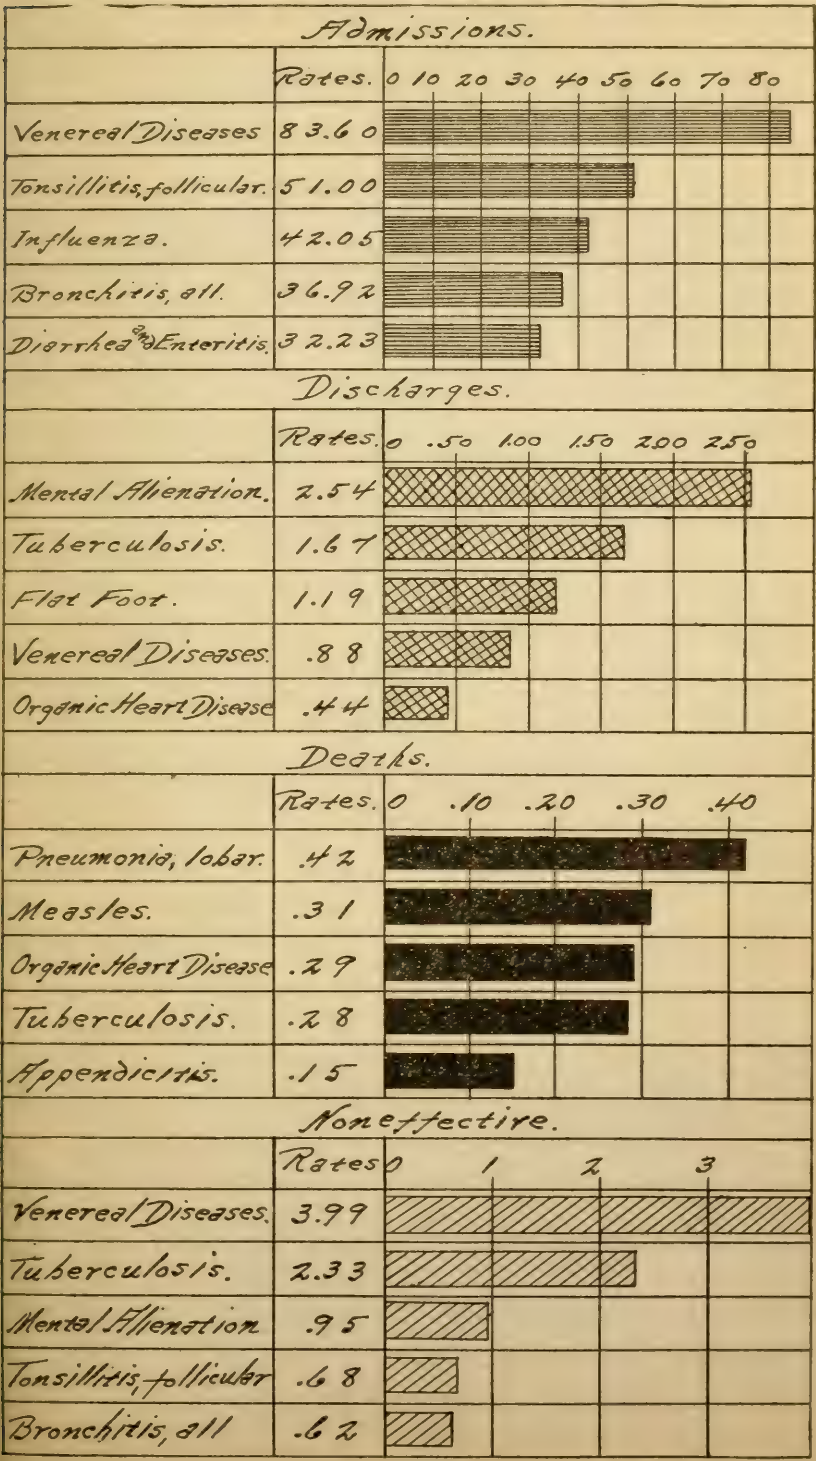
[Admission, discharge, death, and noneffective rates for diseases having highest rates, year 1915.]



The principal causes of discharge with the percentage of the total number of discharges for disease were: Mental alienation, 21.27; tuberculosis, 14.01; flat foot, 9.99; venereal diseases, 7.39; epilepsy, 5.06; and diseases of the digestive system, 4.93. The order of frequency was the same for the year 1914, as in the years 1913 and 1912, except that flat foot changed places with venereal diseases.

DEATHS.

The death rate for diseases for the United States enlisted men was 2.99 per 1,000, as compared with 2.52 in 1914 and 2.62 in 1913. That for external causes was 2.41 per 1,000 in 1915, as compared with 2.30 in 1914 and 2.33 in 1913. The total for diseases and external causes was 5.40 in 1915, as compared with 4.82 in 1914 and 4.95 in 1913. The total number of deaths in 1915 was 349; of this number 193 were due to disease and 156 to external causes. Deaths as well as discharges which occurred in the United States among those who have been invalided home from their commands in foreign service have been charged to the country where such commands were stationed. Tuberculosis caused 18 deaths in 1915, 29 in 1914, and 24 in 1913; measles, 20 in 1915, 8 in 1914, and 11 in 1913; pneumonia (lobar), 28 in 1915, 15 in 1914, and 19 in 1913; and appendicitis, 10 in 1915, 9 in 1914, and 8 in 1913. There were 40 suicidal deaths in 1915, 37 in 1914, and 33 in 1913; 104 accidental deaths, 25 of which were by drowning, 25 by crushing, and 25 by firearms in 1915, as compared with 85 deaths in 1914 and 92 in 1913.

The following table shows the whole number of deaths occurring among both officers and enlisted men, the differences accounting for officers' deaths, which are used above, in order that accurate comparison could be made with statements from last year's report:

TABLE No. 8.—*Deaths among officers and enlisted troops serving in the United States continental (excluding Alaska), year 1915.*

PREVALENCE OF SPECIAL DISEASES.

TYPHOID FEVER.

Eight cases of typhoid fever (officers and enlisted men) occurred in the entire United States Army during the calendar year 1915. Only four of these were among troops stationed in the United States, the other four occurred in the island possessions. During the year the Army was scattered over the earth through a wide range of latitude in Alaska, in Panama, in China, in Porto Rico, in Hawaii, in the Philippines, in Mexico, and in the various camps, posts and garrisons north, south, east and west of the continental territory of the United States. The mean strength for the year was 103,842.

There were no deaths from typhoid fever and no serious complications followed the cases that occurred.

Of the eight cases reported one was in the person of an officer and seven in enlisted men, including a recruit, who is now known to have been in the prodromal stage of the disease when accepted for enlistment. All except the recruit received the antityphoid vaccination; the officer four years seven months and two days before; the enlisted men showed the following intervals of time between the date of vaccination and the date of sickness:

1. Private, 8 months 18 days.
2. Private, 2 years 1 month 23 days.
3. Recruit, not vaccinated.
4. Private, 1 year 8 months 27 days.
5. Private, 1 year 8 months 12 days.
6. Private, 8 months 9 days.
7. Private, 2 years 7 months 12 days.

Of the four cases occurring in the island possessions (Schofield Barracks), three were enlisted men of the same organization, First Infantry and the fourth an enlisted man of the Fourth Cavalry, all of which occurred within a period of 25 days from the onset of the first case.

Revaccination against typhoid fever upon reenlistment is now required in the same way as revaccination against smallpox. Officers are required to be revaccinated five years after the first course. After two completed courses of vaccination are given no further is required.

Duration of immunity: The question of the duration of immunity conferred by antityphoid vaccination is still an open one, statistical information being at this time too meager to draw definite and satisfactory conclusions on this point.

The English observers from their experience in India and elsewhere have inclined to the belief that the protection against typhoid fever furnished by the vaccination as they give it, begins to decline between the second and third year following administration.

Students of this subject in our Army, including those most competent anywhere to discuss the matter have with few exceptions ascribed a much greater degree and longer period of protection against typhoid, when the vaccination was made with the vaccine prepared by the Medical Department of the Army and given, as now prescribed, three doses at intervals of 10 days, a total of 2½ cubic centimeters, the first dose being one-half cubic centimeter, the succeeding doses 1 cubic centimeter each.

It is generally understood, of course, that the protection from the typhoid vaccine has never been considered absolute in all individuals, a certain small percentage of persons being incapable of complete immunization against the disease, as is shown by the fact that actual attacks of typhoid fever itself do not always afford freedom from a second attack. Other reasons for the appearance of typhoid among those vaccinated are inert vaccines or defective methods of administration and unusual exposure to highly infective typhoid material.

It may be stated that the disease occurring after antityphoid vaccination, with but few exceptions, shows a much milder course than ordinary, and the death rate is markedly lower among those who have received the antityphoid vaccination.

The following tabulation is for the purpose of comparing the figures for 1915 with those for the years 1914 and 1913:

Typhoid fever, the Army, officer and enlisted men, American and native troops.

Year.	Cases.		Deaths.		Immunized persons.	
	Number.	Rates for 1,000 mean strength.	Number cases.	Rates for 1,000 mean strength.	Cases.	Deaths.
1915	8	0.08			7	
1914	7	.07	3	0.03	1	
1913	4	.04			2	

Attention is invited to Chart P, showing the admission and death rates for officers and enlisted men serving in the United States This chart shows graphically the remarkable decrease in both rates as the result of the use of the antityphoid vaccination. This vaccination was begun—but was voluntary—in 1909, and was made compulsory for the entire Army in 1911. (For the various steps from voluntary to compulsory vaccination, vide annual report of this office for 1912, pp. 52 et seq.)

The increasing use of antityphoid vaccination as a preventio against typhoid by the National Guard is to be encouraged. Thi procedure is now necessary before these troops can be mustered int the Federal service, or be accepted as Volunteers; and to have thi already accomplished is to materially expedite the mustering in o such troops. It is also deemed desirable, in order that standardize results may be obtained, that the vaccine made for the Regula Army and supplied by the laboratory, Army Medical School, Washington, D. C., be used for the troops liable to service.

PARATYPHOID FEVER.

Table No. 10 shows that nine cases of paratyphoid fever occurred in the entire Army during the calendar year 1915, eight of which were confirmed by bacteriological diagnosis, the other being diagnosed clinically. Three of these cases (Nos. 1, 3 and 8) were reported from the Philippine Islands, and one from the Hawaiian Islands, leaving but five distributed throughout the United States—two at Fort Leavenworth, Kans., and one each at Fort Niagara, N. Y., Presidio of San Francisco, Cal., and Douglas, Ariz. All cases had received the full three doses of the antityphoid vaccine (see footnote), except case No. 1, to whom it was administered after his return to duty, and case No. 9, appointed from the Naval Academy, who had not received the prescribed three doses due to the fact that antityphoid vaccination was not instituted in the naval service until 1912, the officer in question having been commissioned in the Army, September 28, 1911.

It is, of course, well understood that paratyphoid fever is a distinct clinical entity and is not typhoid fever, though sometimes resembling atypical cases of that disease. It is caused by a different microorganism, the bacillus paratyphosus, of which two types are distinguishable: *B. paratyphosus* A and *B. paratyphosus* B. In western Europe, as reported, paratyphoid fever is much more frequently due to the B type of bacillus than to the A type. Clinically they are hardly distinguishable, but it is stated that the A fever is apt t last three or four days longer.

Of the nine cases of paratyphoid fever among our troops in 1915 six were caused by the bacillus paratyphosus A, two by the bacillu paratyphosus B, and in the remaining case the diagnosis was clinical

An important feature in the prevention of paratyphoid fever, a in typhoid fever, is the active searching-out of "carriers" and thei prompt isolation and treatment.

NOTE.—It must be understood that antityphoid vaccine is not effective in th prevention of paratyphoid fever.

TABLE No. 10.—*Paratyphoid fever, 1915.*

No.	Rank.	Age.	Organization.	Service.		Date taken sick.	Where sick.	On duty at—	Laboratory findings.	Vaccinated against typhoid.	Result of disease.

9	Second lieutenant.	27	Sixth Field Artillery, appointed from Naval Academy.	4		Nov. 24	Douglas, Ariz...	Douglas, Ariz...	B. Paratyphosus, type A, department laboratory, Southern Department, Fort Sam Houston, Tex.	Officer states had 2 doses about nine years ago.	

It may be stated at this time that paratyphoid fever, heretofore but unfrequently met with in our Army, appeared in the New York division of the National Guard, stationed in the Brownsville district, in August, 1916, principally among the troops at Mission, Tex. A few scattering cases at other points occurred in the same district; in all a total of 120 cases.

The outbreak of this disease was promptly and satisfactorily met. The vaccination against paratyphoid with a mixed Para-typhoid A. and B. vaccine prepared in the laboratories of the Army Medical School was authorized; the searching out of possible "carriers" of the disease was vigorously prosecuted; camp sites were changed, and all sanitary orders rigidly enforced under the direction of inspectors of the Army Medical Corps.

VENEREAL DISEASES.

Special measures for protection against this class of infectious diseases were formulated five years ago, since which time, so far as lies in the power of the Medical Department, they have been vigorously and conscientiously carried out, and it is further believed that in the great majority of instances there has been no laxness in the strict enforcement of the regulations by others in military authority. It should be understood that the prime source of infection in venereal disease lies not within military jurisdiction and control, but in the civilian life, quite apart from the immediate garrison life of the soldier and the rigid supervision incident thereto.

The admission rate for enlisted men in the United States is somewhat lower than for 1914, being 83.60 compared with 89.84 per 1,000.

The noneffective rate was considerably higher, being 3.99 per 1,000 for 1915 as against 1.15 in 1914, which may be accounted for (in view of a reduction in the admission rate) by the presence in hospital for a greater length of time of cases of syphilis, there being a decrease in the number of cases so diagnosed of 38 over 1914. For gonorrhea the number of cases is 71 more than last year, and in the local infection, chancroid, the increase is 218. In 1912 there was a large falling off in the number of secondary and tertiary cases of syphilis with a slight increase in the case rate for the primary cases. It will be noted from Table No. 15 that a like decrease has taken place in the number of cases of primary and secondary syphilis, while there is a slight increase in the rate for tertiary cases.

In comparing the figures for 1915 and 1914 with those for 1912 and 1913 and the preceding years it must be borne in mind that the diagnoses made prior to 1911 were determined without the aid of the Wassermann reaction. By reason of this many latent cases are now detected which were largely missed prior to 1911.

By reference to Table No. 12 it will be seen that the admission rate for the total American troops of the Army also was lower than for the year 1914, the rate being 107.71 as against 110.69, while the non-effective rate was but slightly higher, being 4.78 per 1,000 in 1915 as compared with 4.73 in 1914.

Table No. 16 shows the rates of admission for three years of venereal disease at the five recruiting depots. With the exceptions of Jefferson Barracks and Fort McDowell, a marked decrease in the admission rates over 1914 and 1913 is noted. Fort Logan has the lowest rate for 1915, being a reduction of over one-half compared with the rate prevailing for 1914. Taking the five recruit depots as a whole, the total admission rate is lower for 1915, being 102.68, as compared with 113.66 in 1914 and 127.87 for 1913. Jefferson Barracks has the highest rate of any of the depots, 157.11 per 1,000 in 1915, as compared with 135.48 in 1914, with a rate of 119.40 in 1915 at Fort McDowell, as compared with 94.36 for 1914.

Table No. 17 gives the relative standing and rates with reference to venereal disease for 45 posts in the United States. The post having the highest rate for venereal disease is Fort Sam Houston, Tex., changing places with Fort Oglethorpe, being third and first, respectively, for 1914. The fact that Fort Sam Houston leads all other posts for venereal disease this year can be accounted for by the mobilization of a good portion of our troops on the southern border. But such facts seem only to extenuate, but not to excuse, the failure to lower the ratio of these preventable diseases.

The most marked improvement is shown at Fort Greble, R. I., where the admission rate was reduced from 94.94 in 1914 to 47.75 per 1,000 in 1915; where formerly Greble stood No. 14 on the list, this year it stands No. 31; Fort Howard, which last year stood No. 23 on the list, this year stands No. 41, while Fort Totten moved from No. 20 last year to No. 32 this year.

MALARIAL FEVERS.

The admission rate for malarial fever, officers and enlisted men, in the United States is slightly higher than for the year 1914, being 12.37 per 1,000, as compared with 10.74 in 1914, and with the exception of 1913 is lower than for the previous three years. The rate for 1913 was 8.62; that for 1912, 13.99; that for 1911, 14.35; and for 1910, 16.07.

The noneffective rate for 1915 was 0.27, as compared with 0.24 in 1914, 0.18 in 1913, 0.30 in 1912, and 0.35 per 1,000 in 1911.

No discharges, but 2 deaths, resulted from malarial fevers during the year. Chart R shows comparative rates for this disease for the entire command, including officers.

TABLE No. 20.—*The 10 posts of more than 200 (officers and enlisted men) in the United States, continental (excluding Alaska), having the highest admission rates for malarial diseases, year 1915, compared with 1914.*

[Ratio per 1,000 of mean strength.]

Posts.	Mean strength.		Malarial diseases, total ratio.	
	1915	1914	1915	1914
Fort Moultrie, S. C	397	469	73.05	8.53
Jefferson Barracks, Mo	1,413	1,491	37.51	22.13
Washington Barracks, D. C	508	725	33.46	73.10
Fort Myer, Va	694	702	27.38	28.49
Fort D. A. Russell, Wyo	264	178	26.52	....
Fort Sill, Okla	1,182	1,013	26.23	5.92
Fort Screven, Ga	444	503	22.52	13.92
Fort Leavenworth, Kans. (military prison)	272	258	22.06	27.13
Fort Sam Houston, Tex	1,293	1,096	17.79	24.64
Fort Caswell, N. C	290	329	17.24	21.28

From the above table it will be noted that Washington Barracks, D. C., which had an admission rate in 1914 of 73.10, this year shows but 33.46 per 1,000, a remarkable reduction, due to the vigorous antimosquito campaign that is being waged where mosquitoes are prevalent. The excessive rate shown for Fort Moultrie, S. C., which is No. 1 on the list, is not enviable when compared with that for 1914, 8.53 per 1,000.

TUBERCULOSIS.

The following tabulation shows for the total American Army, and separately for the different countries where the Army has been stationed continually, the case rate for tuberculosis (all forms) for enlisted men for the last seven years. In this tabulation all readmissions during each year have been eliminated, so that the actual occurrence of tuberculosis (all) is shown:

Tuberculosis (all), enlisted men, case rates only.

Year.	United States.	Philippine Islands.	Alaska.	Hawaii.	Transports.	Panama.	China.	Total.
1915	2.68	6.42	1.31	3.62	5.34	6.12	5.24	3.52
1914	2.69	7.31	1.09	3.01	2.85	2.49	6.69	3.35
1913	3.07	6.70	1.75	4.24	4.37	3.76	3.29	3.66
1912	3.25	5.02	4.18	2.07	2.74	....	....	3.49
1911	3.64	3.77	2.68	1.99	1.76	....	....	3.55
1910	3.34	5.46	1.85	4.10	.80	....	....	3.65
1909	4.53	5.06	3.76	2.96	3.00	....	....	4.53

The above tabulation shows that for the year 1915 the rate for tuberculosis in the United States is lower than for any previous year recorded, being 2.68, as compared with 2.69 per 1,000 for 1914. The general rate for the American Army was 3.52, which is slightly higher than for the year 1914. All of the places shown in the tabulation have higher rates than for the United States, with the exception of Alaska, the rate for which is 1.31 per 1,000, as compared with 1.09 for 1914. The rate for the United States, when compared with former years, is encouragingly low, while, with the exception of the Philippine Islands and China, the other places show an increased rate, all of which exceed that for the American Army.

The following tabulation shows for the total American Army, and for those parts stationed in the United States and the Philippine Islands, the rates for tuberculosis (all) for discharges for disability, for deaths, and for noneffectiveness for the last four years:

	Year.	Discharged for disability.	Deaths.	Noneffective.
Army, American troops	1915	1.79	0.33	1.80
	1914	2.07	.47	1.77
	1913	2.26	.49	1.94
	1912	1.56	.31	1.40
American troops, United States	1915	1.67	.28	2.33
	1914	2.10	.47	2.23
	1913	2.16	.40	2.34
	1912	1.67	.27	1.65
American troops, Philippine Islands	1915	3.28	.50	.50
	1914	3.41	.28	.60
	1913	3.95	.79	.56
	1912	1.46	.57	.53

From a study of Table No. 21, giving the occurrence of tuberculosis at Army posts in the United States, Vancouver Barracks, Wash., after dropping down on the list to one case during 1914, has, as in the years 1913, 1912, and 1911, more cases of tuberculosis than any other station, with the single exception of Sam Houston, Tex., both having seven cases recorded for the year 1915.

Four more cases of this disease occurred than during the year 1914, although a reduction over 1913 of the same number of cases.

TABLE No. 21.—*Tuberculosis (all) at Army stations, United States, continental (excluding Alaska), 1915, compared with 1914 and 1913, officers and enlisted men.*

TABLE NO. 23.—*Undetermined fevers, 1915, by countries, officers and enlisted men, including Philippine Scouts and Porto Rican troops.*

Diseases.	United States (continental excluding Alaska.	Alaska.	Hawaii.	Philippine Islands.	Canal Zone, Panama.	China.	Porto Rico.	Army transports.	Total.
Febricula	25	....	5	27	....	....	2	....	59
Fever, simple continued	8	....	5	33	....	1	....	....	47
Fever, type undetermined	72	1	1	30	2	11	3	....	120
Ephemeral fever	5	....	....	....	....	....	....	....	5
Total	110	1	11	90	2	12	5	....	231
Ratio per 1,000 of mean strength	1.65	1.27	1.24	5.00	0.34	8.71	6.95	....	2.22

From the above table it will be noted that the admission rate for these fevers in the United States was 1.65 per 1,000 of mean strength. The same rate for 1914 was 1.49, that for 1913 was 2.65, and for 1912, 1.94 per 1,000. China has the highest admission rate for this class of fevers, 8.71 per 1,000; Porto Rico comes next with 6.95 per 1,000. The rate for the United States alone is lower than the total rate for these fevers. It might be well to again state, as in previous reports that in questions of doubt, procedures are used in the laboratory diagnosis of typhoid and paratyphoid fevers so as to exclude any possibility of overlooking these two diseases.

MENTAL ALIENATION (ENLISTED MEN).

It is impracticable to compare the admission rate for this class of disturbances with the rate for diseases formerly classified and published under the term "insanity." The diseases included under the term "mental alienation" used in the present nomenclature, which was put into use January 1, 1912, include several conditions not taken into consideration under the term insanity, such as defective mental development, constitutional psychopathic state, hypochondriasis, and nostalgia. The case admission rate for mental alienation (all) for 1915 was 3.04 per 1,000, and the discharge rate 2.54, as compared with 3.83 per 1,000 for the admission rate and 3.02 for discharge rate during the year 1914. The admission and discharge rates for the entire Army for 1915 were 3.84 and 3.30 per 1,000, respectively.

ALCOHOLISM.

The admission rate for alcoholism in the United States for the year 1915 was 13.07 per 1,000, which is lower than for the preceding year, when it was 13.46. It is exceedingly gratifying to note that there has been a steady decrease in this rate since 1907, when the rate was 36.09, before which year there was a steady increase for eight years. The rate for 1915 is the lowest on record in the Army since the year 1870. As it has been stated before, the rates given are not representative of the true amount of intemperance existing in the Army, but as they are all calculated from similar data, i. e., the number of cases in which medical assistance intervenes, they are useful as ndices of alcoholic excesses. There can be no doubt but that this remarkable decrease in the rates is properly attributable to the effect produced by the act of Congress in stopping the pay of officers and enlisted men when incapacitated for duty because of sickness due to drug addiction, alcoholism, or other misconduct.

Smallpox, 1915.

Rank and organization.	Age.	Station.	Date taken sick.	Date of successful vaccination.	Date of unsuccessful vaccination.	Disposition.	Length of service.	Date of enlistment.	Probable source of infection.	Previous attack.	Remarks.

SMALLPOX.

Three cases of smallpox occurred within the United States proper during the year, making an admission rate of 0.05, with no deaths.

MEASLES.

During the year 1915, 555 cases of measles occurred in the Army in the United States, with 20 deaths and 8 discharges. In 1914 there were 448 cases, with 8 deaths and 1 discharge.

An epidemic during January, February, March, April, and May at Jefferson Barracks, Mo., resulted in 147 cases being reported, while at Columbus Barracks, Ohio, during February, 60 admissions for measles are recorded, with 6 and 10 deaths, respectively. Of the 147 cases at Jefferson Barracks, 56 occurred during the month of January and 50 during the month of March. The depots having the next highest number of admissions for the year were Fort McDowell, Cal., with 27 cases and no deaths, and Fort Logan, Colo., with 26 cases and 1 death. The mean strengths during the year at the above-mentioned recruit depots were: Jefferson Barracks, 1,391; Columbus Barracks, 1,143; Fort McDowell, 854; and Fort Logan, 553.

The diversion of accepted applicants to other stations resulted in the disease assuming no greater proportions than shown at Columbus Barracks. With the advent of milder weather the change in habitat from the barracks to out-of-door life usually marks a decline in the incidence of the disease, which would tend to bear out the contention that crowding is a very material factor in the spread of this disease.

This office renews its recommendation that either additional barrack room be provided or that the number of accepted applicants sent to the recruit depots be curtailed, in order that an epidemic such as threatened at Columbus and Jefferson Barracks might be averted. The continuance of an epidemic is in the main attributable to contact of nonimmunes with infected cases before the latter have shown any symptoms. That the death rate was not higher for the year 1915 is directly due to the response on the part of The Adjutant General to recommendations of this office for the removal to other quarters of the majority of the personnel before the disease had assumed greater proportions than the figures above given would indicate.

EPIDEMIC POLIOMYELITIS.

No cases of this disease occurred among soldiers or civilian employees of the Army or among the families resident in the various garrisons. During the past year, however, poliomyelitis appeared in the vicinity of several of the larger military reservations in the astern United States, notably at Highland Falls, N. Y., immediately adjoining the United States Military Academy Reservation at West Point, N. Y. Nineteen cases with five deaths occurred. Stringent quarantine measures were promptly and successfully put in operation by the academy authorities upon the recommendation of the surgeon. These measures were as follows:

> The following quarantine regulations with reference to poliomyelitis are established:
>
> 1. Children under 16 years of age residing at West Point will not be permitted to eave the reservation. Children under 16 years of age residing elsewhere will not be ermitted to enter the reservation.
>
> 2. All general pleasure travel to and from West Point is discontinued.
>
> 3. Guests of individuals residing at West Point and guests of the hotel to be author-.ed to visit the reservation by permit only. Upon arrival at West Point they will be held pending investigation and issuance of permit if warranted.

4. Travel to and from West Point on business to be by permit only. Those coming to West Point will be held at point of entrance until necessary investigation is made and permit issued.

5. All soldiers of the garrison at West Point will be quartered on reservation and will not be allowed to leave the reservation during the continuance of the quarantine.

6. Classified civilian employees to be permitted to enter and leave the reservation by permit only.

7. Employees of the West Point Army mess and cadet mess will, as far as practicable, be quartered on the reservation, and others not so quartered will enter and leave the reservation by permit only.

8. Tailors and similar employees of the cadet store will enter the reservation at the railroad station or south gate and will proceed directly to the cadet store, and when through with their work at that place will leave the reservation by the most direct route.

9. All servants employed on the reservation will be required to live thereon and will not be permitted to pass back and forth from the reservation.

10. Laundresses will assemble at the south gate at the time specified by the officer in charge of the cadet laundry and will there be transported by wagons to the laundry. Upon completion of their work at the laundry, they will be transported back to the south gate. They will not be permitted to pass back and forth on foot through the reservation.

11. General laborers employed under the quartermaster will assemble at the south gate and be conducted by a noncommissioned officer to their work. Upon completion of their work they will again be assembled and conducted back to the south gate.

12. The vending of food products of any kind on the reservation is prohibited. Vegetable, fruit, bakery, and butcher wagons will not be permitted to enter the reservation.

13. In all cases not covered by the above, entrance to and departure from the reservation will be by special permit only, to be issued from these headquarters.

14. All persons residing on the reservation or who may be employed on the reservation will at once notify the surgeon of any suspicious case of illness occurring in their families or in the same house in which they reside.

15. The above measures are adopted as necessary for the health of those resident or employed at West Point.

CEREBROSPINAL MENINGITIS.

Twenty-three cases of this disease, with 9 deaths, occurred during the year 1915 in the United States. In 1914 there were 14 case with 5 deaths.

INFLUENCE OF STATION.

The posts having the highest admission rates, from all causes, were Forts D. A. Russell, Wyo., with a rate of 1,303.03; Caswell, N. C. with a rate of 955.17; George Wright, Wash., 943.61; Leavenworth Kans., 930.95; and Myer, Va., 880.40.

The posts having the highest noneffective rate for the year 191 were: Forts Bliss, Tex.; Sam Houston, Tex.; D. A. Russell, Wyo. Huachuca, Ariz.; and Sheridan, Ill., in the order named. The rate from all causes were 95.24, 77.63, 37.86, 34.91, and 25.43 per 1,000 respectively. The average number of days' treatment for each cas was as follows: Fort Bliss, 43.68; Fort Sam Houston, 35.68; For D. A. Russell, 10.60; Fort Huachuca, 39.12; and Fort Sheridan, 11.6

The five posts having the lowest admission rate, from all causes during the year, were: Forts Casey, Wash., 190.62; Yellowston Wyo., 261.90; Stevens, Oreg., 294.57; Winfield Scott, Cal., 330.6 and West Point, N. Y., with 343.68 per 1,000.

The posts having the lowest noneffective rates, from all causes, wit their rates, were: Forts Preble, Me., 3.96; Hamilton, N. Y., 5.9 Yellowstone, Wyo., 6.06; West Point, N. Y., 7.16; and Alcatra

Island, Cal., 8.63 per 1,000. The average number of days' treatment for each case was: 4.15, 5.53, 8.44, 7.60, and 7.90, respectively.

Of the recruiting depots Fort Slocum, N. Y., had the highest admission rate from all causes, 1,341.10, and Jefferson Barracks, Mo., the lowest, 815.99 per 1,000; the latter depot had the highest average number of days' treatment for each case, 15.52. Fort Slocum had the highest noneffective rate from all causes, 38.64 per 1,000, and Fort McDowell, Cal., the lowest, 11.12. The highest death rate occurred at Jefferson Barracks, Mo., being 14.86 per 1,000, and the lowest at Fort McDowell, Cal., 1.15.

The Western Department, as last year, had the lowest admission rate, 556.47 per 1,000, as compared with 437.09 for 1914, with the exception of the independent stations, which had a rate of 508.43 per 1,000, as compared with 579.81 per 1,000 for 1914. A considerable increase is noted in the Eastern Department, whose rate for 1915 was 654.32, as compared with 567.44 per 1,000 for 1914. The rate for the recruit depots, while still high, is slightly lower than for 1914, being 1,070.17 for 1915, as compared with 1,087.43 per 1,000 for 1914.

The independent stations had the lowest noneffective rate, 10.46 per 1,000, for the year 1915, as compared with 11.18 for the Western Department, 12.72 for the Mexican border, and 16.21 for the Eastern Department.

The Central Department had the lowest death rate, 2.29 per 1,000 for 1915, as compared with 7.97 for 1914, and the Western and Eastern Departments and the Mexican border next in order with 6.26, 6.28, and 6.33 per 1,000, respectively.

Tables Nos. 24 and 25 show the posts having the highest and the lowest ratios of admission and noneffectiveness in the United States as a whole.

INFLUENCE OF RACE.

The colored troops (enlisted) had higher rates than the white for noneffective and discharges, being 31.26 and 22.96, as compared with 25.52 and 13.23 per 1,000, respectively, for 1915. The respective rates for 1914 were 33.73 and 27.90 as compared with 23.05 and 14.42. The admission rate for white troops was higher than for the colored, being 708.51 as compared with 590.81.

For venereal diseases the admission rate for the white troops was 34.08, and for the colored 71.75 per 1,000 for 1915; for alcoholism the rate for the white troops was 13.49, and for the colored, 2.46; for tuberculosis (all kinds) for the white was 2.72 and for the colored, 1.64; for bronchitis the rate for white was 37.07, and for colored, 33.21; for diarrhea and enteritis the rate for white was 32.12, and for colored, 35.26; and for tonsilitis, acute follicular, the rate for white was 52.18, and for colored, 21.32.

The relative prevalence of the other diseases in the two races with comparisons are shown in Table No. 7.

Chart R.—United States. Officers and men.

[Admission rates for typhoid fever, undetermined fever, and malarial fevers, years 1906–1915.]

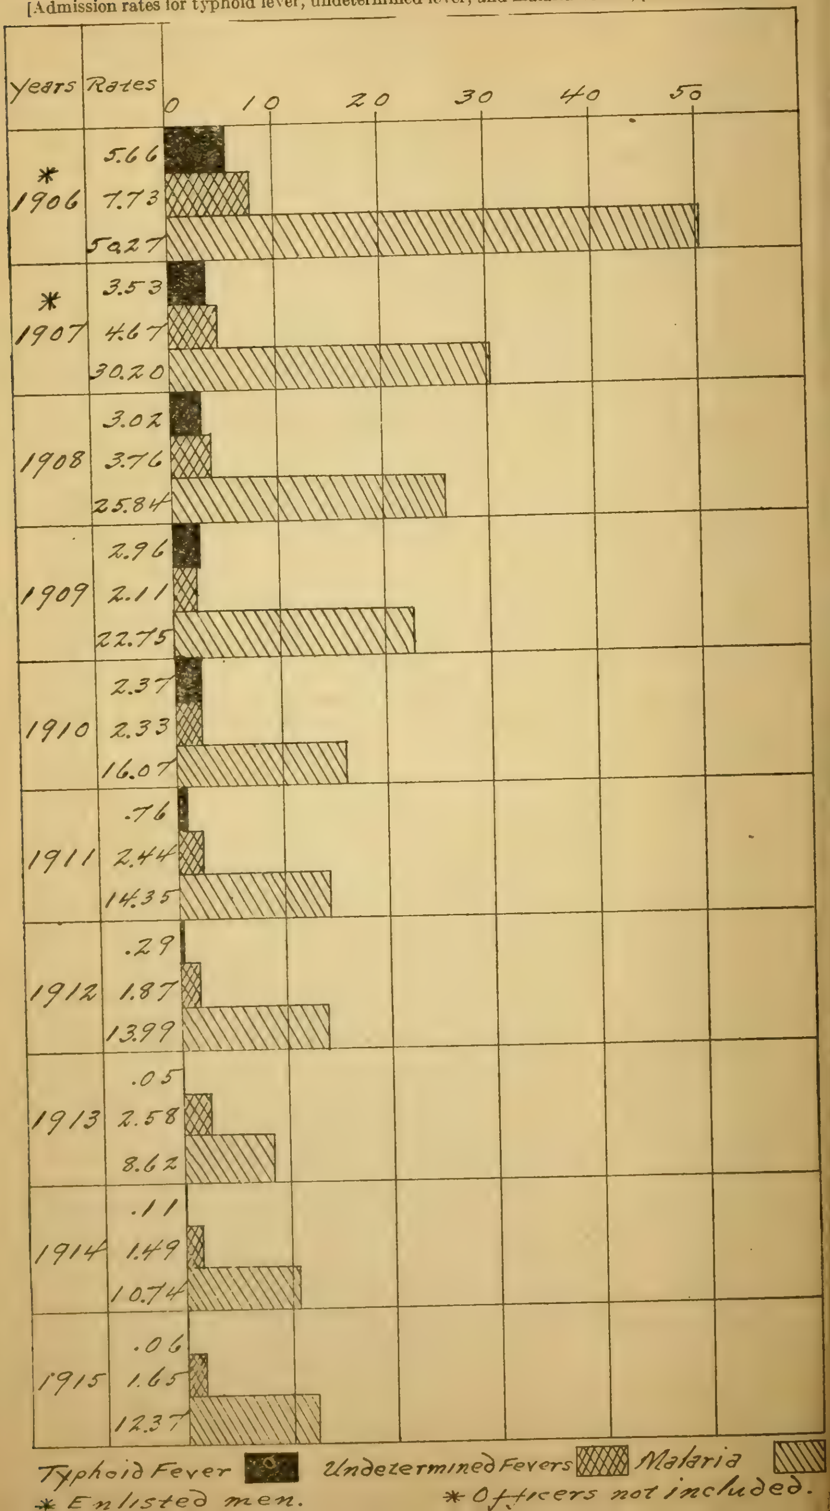

Chart S.—United States. Enlisted men.

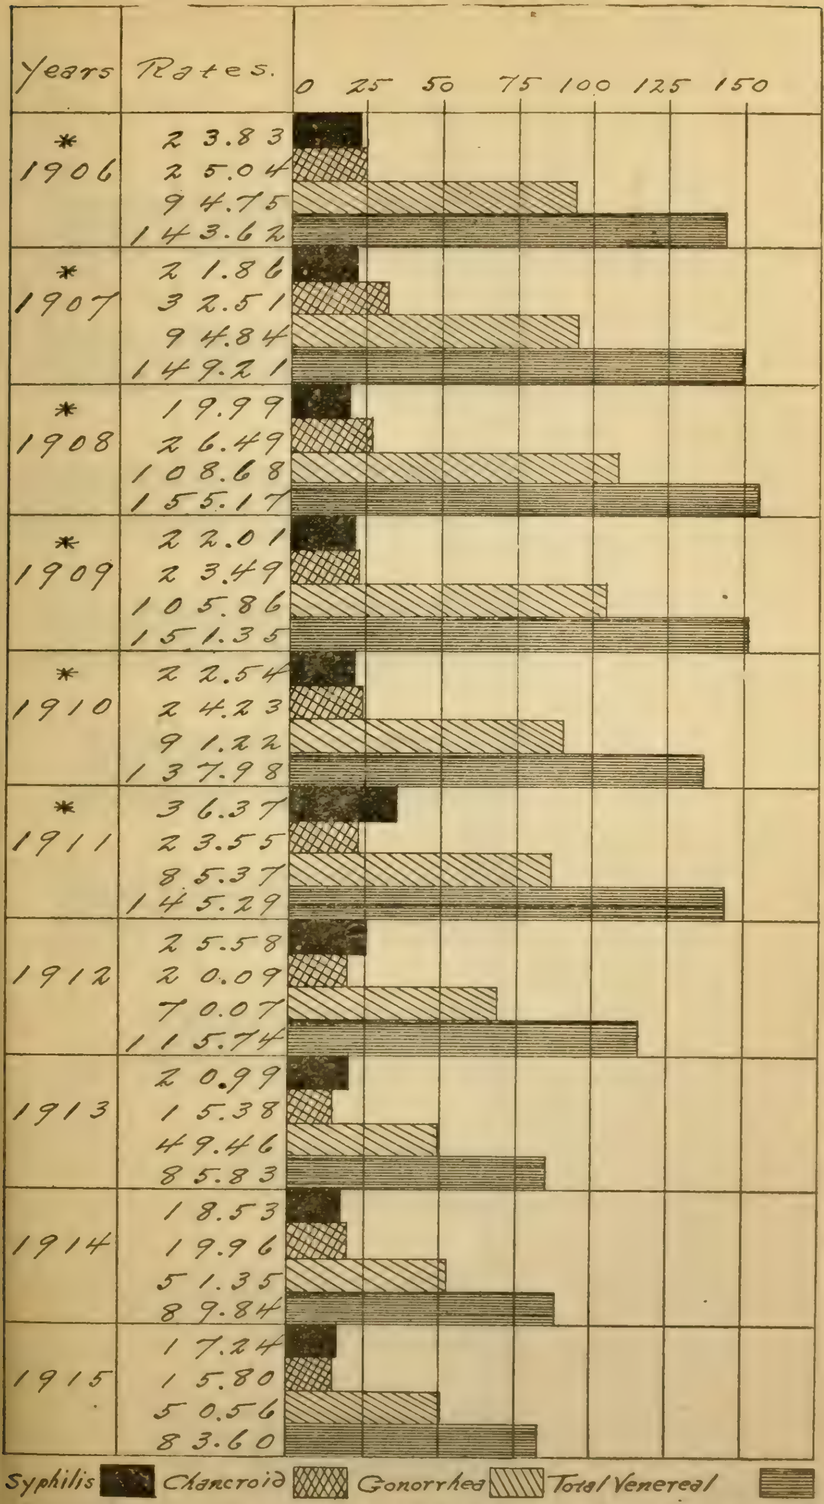
[Admission rates for syphilis, chancroid, gonorrhea, and total venereal, years 1906-1915.]



* Readmitted cases deducted to correspond with figures for years preceding 1906, and 1912 to 1915.

Chart T.—United States. Enlisted men.

SANITATION, UNITED STATES.

The general sanitary conditions throughout the United States for the Army have been very satisfactory. Such defects as were reported were of a minor character and were promptly remedied through the cooperation of those in authority. At several of the newer posts in the Canal Zone complaints have reached the office in regard to the absence of screening against mosquitoes. Unfortunately it has not been possible to make corrections in all cases through a lack of appropriation of funds.

The department surgeon, Eastern Department, under the subject of hospital treatment in the Canal Zone, remarks:

I desire to invite attention to the unsatisfactory condition in the matter of hospital treatment in the Canal Zone for those in the military service, and more particularly for the dependent members of their families, who are accorded the privilege of hospital treatment, subject to a charge for subsistence and medicines, everywhere else in the service where troops are serving and the facilities exist, except in this district. Aside from the hardship just mentioned, I consider the present arrangement, whereby all the sick of the service are sent to the Canal Zone hospitals except those requiring dispensary treatment only, and by which the medical officers there on duty are deprived in large part of the care of the sick and in whole of the professional work and administration of hospitals, as tending to the deterioration of the efficiency and morale of the medical officers concerned. In my opinion, the restoration to the Medical Corps of its proper function of the care and control of all military sick, by the establishment of military hospitals in the Canal Zone on exactly the same basis as elsewhere in the Army, is the most important medico-military matter in this department.

On the subject of sanitary inspections, he further remarks:

No sanitary inspections were made during the year. The War Department under date of July 8, 1915, decided that "Such general inspections except for troops in the field in large camps should be made as a rule by officers of the Inspector General's Department, that inspections by sanitary inspectors should be limited to special cases requiring unusually detailed and careful inspection of a more or less technical character," etc. A great part of the work of the sanitary inspector is of a technical nature, and no other inspector is capable of giving such expert information to the department commander or the Surgeon General, who are by these inspections kept fully informed as to the proficiency of the personnel, care of the sick, sanitary conditions and health of the troops, not to speak of the inestimable disciplinary value that accrues to the medical personnel of the various posts from a knowledge that searching technical inspections will be made each year of all things pertaining to the Medical Department by an official sanitary inspector. As a matter of fact, the sanitary inspector was called upon to take over the inspections previously made by the department surgeon, who was required by regulations, ever since the Civil War, to inspect every post in his department at least once a year.

Further he states:

In the matter of winter armory inspections by medical officers, the fact that there have been assigned to districts five medical inspector-instructors, has improved the situation very much, so far as the post surgeons are concerned, it having been necessary to recommend very few details for this duty. But in regard to the summer encampments, where the services of a medical inspector-instructor are required for every organization which has attached to it sanitary personnel, the department was put to it to find officers available at the times and places required. In the vicinity of Boston, last summer, there were six different encampments of the Massachusetts Volunteer Militia at different places at the same time. The encampment of United States troops at Plattsburg, to which students and business men were invited, lasting, as it did, more than three months, required the services of a number of medical officers in addition to those serving at Plattsburg Barracks. The situation was such that it was necessary to recall the sanitary inspector from leave and send him up to Plattsburg Barracks to administer the hospital at that post.

In commenting upon the sanitary conditions in that department during the year, the department surgeon, Western Department, states:

> The sanitary conditions throughout the department for the year were very good. A few defects were noted on the monthly reports, and where possible were promptly corrected. The following is deemed worthy of special note:
>
> The water supply for the Presidio of San Francisco, Fort Winfield Scott, the Letterman General Hospital, Fort Mason, and the transport docks, is obtained from a small stream that arises from springs on the Presidio Reservation and flows a short course near the southern boundary of the reservation to the sea. There are many buildings just outside the reservation and the slope of the creek is abrupt and such that contamination by drainage from the adjacent streets and buildings and leaking sewers is always a possibility. At the pumping station the water is subjected to rapid mechanical filtration with the addition of a coagulant, and the laboratory findings of the filtered water have been satisfactory; but the dam is wooden and in bad order and the sediment tank is too small to perform its function. Recommendations have been made that a concrete dam and two sediment tanks be built, and the item has been included in the 1917 estimate to Congress. As the large number supplied with water from this plant, and the liability of the supply to contamination makes it important that the filtration plant should be kept in the highest state of efficiency, it is believed that the work recommended is of considerable importance.
>
> The surgeon at Vancouver Barracks reported the water supply endangered by a cesspool in use within 75 yards of the wells. A requisition for the construction of a septic tank for the disposal of this sewage was forwarded to the War Department "approval recommended" under date of November 30, 1915.
>
> The surgeon, Presidio of Monterey, Cal., recommended in the sanitary report for December, 1914, the "Extension of existing barrack buildings to provide sufficient squad rooms to give at least 60 square feet floor space to every man; the installation of an adequate heating and ventilating system in all barracks; the installation of modern plumbing (water-closets and urinals) and adequate hot water system for bath rooms; connection of barracks to bath rooms by covered passage." The foregoing has been the subject of considerable correspondence, and the present status is that estimates for this construction (as modified in the office of the Quartermaste General) were to be included in the estimate for the fiscal year 1917.

The department surgeon, Central Department, in his annual repor for the calendar year 1915, states:

> All conditions were cheerfully met and the duties required of the medical officer were satisfactorily performed, no complaint being received as to unsatisfactory o inadequate service. The service of the medical officers assigned as locum tenens a posts was also satisfactory.

Speaking of the venereal situation in the department, the surgeo at Fort Leavenworth is quoted as follows:

> The venereal rate has been somewhat above the average for the Army. Care ha been taken to make every provision for the convenience, comfort, and privacy of th men who come to the hospital under the provisions of G. O. 17, W. D., 1912, for th cleansing and disinfecting treatment prescribed. A man of the Hospital Corp detachment is on duty at all hours of the day and night to supervise the procedur The medical officers also take occasion to point out to the men the importance of th sanitary precaution for those who will expose themselves.
>
> A wide difference exists between the various organizations as regards the carryi out of the provisions of G. O. 17, W. D., 1912, and it is believed that this has dire relation to the amount of interest which the company officers take in the matte The success of some officers in educating their men to take this sanitary precauti shows that all could achieve a reasonable amount of success by earnest and persiste efforts. It is believed that in the case of company officers who fail to attain a reaso able amount of success in the matter the fact should be noted on their efficien reports by commanding officers under the heading of remarks.

Regarding sanitation, the department surgeon adds:

> The posts in this department, all with garrisons depleted by the departure of the Second Division to the southern border, nearly three years since, have, as a rule, all been caring for themselves, with more or less difficulty, owing to their shortage of personnel.
>
> The annual reports concerning sanitation from all posts are usually brief, expressing satisfaction, and there is no reason to suppose that there are any sanitary questions in the department of real urgency.
>
> The following conditions, however, have existed for several years, during which complaints have come from Forts Leavenworth and Brady of a smoke nuisance from the use of soft coal, with recommendations for the substitution of hard coal. The greatly increased expense of such a change has, however, militated against its adoption.
>
> At Fort Russell the completion of the new post city water-supply plant is expected within a few weeks, which will permit the use of city water with confidence. This will apparently terminate an agitation for pure water lasting for years.
>
> At Fort Meade the damming up of the post sewer at terminus into Bear Butte Creek has for years prompted recommendations for the construction of a septic tank.

The sanitary conditions, as reported by the department surgeon, Southern Department, have been generally good. The men are well protected from weather. Suitable buildings were erected for the kitchens and mess halls and they have been effectively floored and screened. Latrines are boxed and fly proof. Lime and flytraps are supplied latrines. Kitchen wastes and manure are usually carted away daily by outlying farmers. Habits of men are, as a rule, very good. Food supply and preparation are satisfactory.

In speaking of the preventable diseases with which they have to contend on the southern border, the department surgeon remarks:

> War and famine have paved the way for typhoid fever, smallpox, typhus fever, and influenza in severe forms, and these epidemic diseases have all prevailed in Mexico and among the refugees who have flocked to this side of the border. The fact that smallpox has been limited to two cases, typhoid fever to two, and epidemic meningitis to one show how splendidly under control are these diseases, which formerly caused such morbidity and mortality.

Further, he adds:

> The prevailing diseases have been gastrointestinal, bronchial, and venereal. Acute follicular tonsillitis and influenza have prevailed extensively during the colder months, especially at Douglas, Ariz. They seem connected, in their mode of spread, with poor ventilation in the tents of the men and in the various moving-picture shows frequented by the commands. Improvement has followed a greater care in seeing that the tents are properly aired during the day and ventilated at night. The proprietors of the various picture theaters have likewise cooperated to improve their ventilation.
>
> There were relatively a large number of cases of diphtheria. Twelve of these cases occurred at Fort McIntosh from January 6 to May 3. The usual methods of isolation, careful bacteriological examinations of throats, and immunization of contacts with antitoxin kept the disease well in check. The majority of cases seem to have been contracted in Laredo, where an epidemic prevailed during the spring.

In explanation of the high rate of venereal diseases it is stated:

> It is partly due to the soldiers obtaining 24-hour passes and failing to take the prophylactic treatment soon enough after exposure to be of much value. For such as these, and especially for the use of troops serving on the border and on detached service, where the usual prophylactic can not be given, it is recommended that the prophylactic tubes formerly authorized be again issued.

Continuing on this subject of venereal disease, the following is quoted from the report of the surgeon, Fourth Infantry, Brownsville, Tex.:

> At Brownsville the usual factors are: (*a*) The small number of prostitutes present in a small town; (*b*) the exceedingly low grade of those who are here. Cause: (*a*) Operates by the whole number of women becoming more rapidly diseased than in a

larger town and increasing the chances of contagion. Light is shed as to the grade of these women by the fact that pediculosis pubis is exceedingly prevalent in the command, as many as eight cases having been found in one company at the semimonthly physical inspection. The large majority of these women are Mexican-Indians, which fact needs no further comment as to their hygienic condition.

The large number of prophylactic treatments given indicates a general knowledge of the importance of the measures and would give ground to expect a small venereal rate were it not for the well-known means of circumventing the order or of partial compliance that is sufficient to avoid legal penalties but not sufficient for therapeutic benefit. All cases of venereal exposure without venereal prophylaxis, where the facts could be established, have been tried by summary court-martial. There have been 17 convictions for this offense during the year.

The surgeon, Twelfth Infantry, Camp Stephen Little, Nogales, Ariz., contributes the following on the subject:

> This station can point with pride to the unusually low venereal rate for the year, which could only have been secured through the system of venereal prophylaxis in use. During the year there were recorded 5,401 prophylactic treatments, an average of 450 per month. These figures show the great extent to which the men have been exposed to venereal disease. Prostitution in this vicinity is not regulated and most of the prostitutes are Mexican women who loiter in the vicinity of the camp. Undoubtedly a very favorable influence in reducing the number of vereneal infections has been the absence of saloons in the town of Nogales. A sober soldier after exposure to venereal disease resorts to the prophylaxis and properly carries out the treatment, but a venery associated with drunkenness is a serious menace to an individual's health and undoubtedly is the cause of so-called failures of our venereal prophylaxis.

The following, quoted from the report of the surgeon, Eighteenth Infantry, Douglas, Ariz., has the approval of the department surgeon:

> When cases are transferred to other hospitals their subsequent history under present methods is unknown to the medical officers who cared for patients originally. It would increase the interest in following cases, and be very instructive, if some method could be instituted of reporting changes in diagnosis, complications, and final disposition of these patients to the officers who have formerly treated them.

The surgeon, Fort Sam Houston, Tex., in his report to the department surgeon, submits the following on "Patients refusing operations:"

> The service on the border is not attractive, and as a result many men take advantage of every opportunity to leave the Army by discharge. In my opinion this accounts for the many refusals to undergo operations to render the patient fit for the military service. I am keeping a list of these refusals, and at the proper time will forward it to The Adjutant General of the Army, with remarks, with a view of having the present privilege of refusing operations revised.

The surgeon, Sixth Cavalry, which was stationed at Harlingen, Tex., reports the following:

> *Skin and subcutaneous affections.*—There has been a great number of sores, boils, abscesses, and ulcers with adenitis and lymphadenitis from infection. The prevalence with which slight scratches became spreading sores, which resist or at least require treatment over a long period, leads one to consider infection from some parasitic fungi. Abrasions from thorns, as well as bites from sand fleas and ticks, common to this section could easily promote this infection. Tropical ulcers are in some cases simulated.
>
> *Intestinal disturbances.*—Quite a number of cases of acute dysentery have been seen. These vary in severity, but have run a fairly similar course, characterized by fever and rapid onset and diarrhea of varying severity, but often with blood and mucus. They have responded rather quickly to treatment, and it is believed to be a bacillary dysentery. No amœbic cases have been observed, except one with a past history.
>
> *Malaria and fevers undiagnosed.*—There have been a few cases of malaria of the type plasmodium vivax diagnosed, and more called malaria, but the disadvantages of no having a microscope, and the habit of the corps men on duty with the troops on the rive of giving quinine has precluded diagnosis in these cases, but I believe malarial infection in this section to be a negligible factor. There have been, however, quite a number of cases of fever type undetermined. These were characterized by rapid onse with or without diarrhea, quite high and continuous fever lasting three or four day

ınd rapid recovery. With the coming of cooler weather and fewer insects, this affection seems to have lessened or disappeared.

Sanitation.—The troops at the outlying stations are for the most part in tents and have been supplied lumber for floors and kitchens. They depend upon such water as he community affords, as wells, rivers, or small lakes, and each troop is supplied with ı Lyster bag. The remainder of the regiment at Harlingen is well camped and supplied with water from the town waterworks, and with electric lights. Tents are loored and kitchens screened. Deep-pit latrines are used and are satisfactory. Flies were very numerous during the warm weather, but few remained after December l, 1915. Mosquitoes at no time have been troublesome, and these mostly of the culex ype. It has, however, been very dry since the troops arrived and all standing water n the vicinity of camp has been oiled. The climate since October 1 has been ideal, ınd it is believed the men are reasonably content. The splendid shooting has afforded he chief amusement. The outlying troops have depended largely upon Hospital Corps men for medical attendance, and the necessity of reliable men for the corps ıas been most apparent, and that they should have sufficient training. An automoıile ambulance was asked for shortly after the troops arrived in Harlingen, and was pproved but never supplied. It would have been most useful, and the scattered roops could have been much more easily and effectively cared for. The ambulance ompany has supplied service only within the town, whereas an automobile ambulance ould have collected the sick and wounded over most of the district.

CAMP SANITATION.

This subject has been one of unusual importance and interest during he past year.

The camps of instruction for civilians at Plattsburg and elsewhere, he assembling of the State troops in camps of mobilization, and the nuster in to the Federal service of 140,000 National Guard in June, 916, have necessitated a thorough consideration of all measures relatng to the care of troops in the field.

The following circular relating to camp sanitation and personal ıygiene, prepared by the Surgeon General of the Army, was early sent o The Adjutant General with a view to its publication for the informaion and guidance of all concerned.

With slight modification this circular has been approved and issued s a general sanitary order of the War Department.

As will be noted, this order embodies largely those methods which he experience of the regular troops in their camps at Vera Cruz, ıalveston, Texas City, San Antonio, and other places on the border nd in Mexico proved to be most valuable and satisfactory for field onditions.

The following sanitary regulations are published for the guidance of all concerned ad should be strictly enforced:

1. *Chief surgeon.*—The chief or division surgeon is charged with the general conduct ıd supervision of the Medical Department in the performance of its duties, and will ake such assignment of personnel as may be required.

2. *Sanitary inspector.*—The sanitary inspector is charged especially with the superision of the sanitation of the camp. It is the duty of commanders to remedy defects ported to them by the inspector.

3. *Water supply.*—Precaution must be taken to prevent contamination of the camp ater supply by keeping all containers scrupulously clean and protected from dust ıd other sources of infection.

An appliance designed by Maj. William J. Lyster, Medical Corps, and carried on ıe supply table as "Water bag, field, sterilizing," consists of a canvas bag of specially oven flax, 20 inches in diameter and 28 inches in length, sewn to a flat galvanizedon ring, hinged so it folds at one diameter. Spliced at four equi-distant points on ıe ring are two crossed pieces of hemp rope, enabling the bag to be suspended on ıy convenient support capable of holding the weight of the bag when filled with ater, which is about 330 pounds. Five nickel spring faucets are placed at equal aces about the bottom edge of the bag. The neck of these faucets is small enough to enter a canteen which can be filled in 10 seconds. The self-closing faucets prevent wastage.

The purpose of the bag is not for transporting water, but to provide a stationary receptacle in which water can be held long enough to sterilize and then distribute it. The empty bag weighs from 7 to 7½ pounds and folds into a convenient package for carriage in the field. It thus can be carried by the soldier on the infantry pack when other transportation is wanting.

After the bag is suspended and filled with water, it is sterilized by the addition of a small amount of hypochlorite of calcium. This is carried in measured doses, sealed in glass tubes. A package of 60 of these tubes weighs 10 ounces and measures 7½ by 3¼ by 4¼ inches. Packed in corrugated paper it will stand rough usage.

The tubes themselves are 3 inches in length by three-fifths of an inch in diameter and are marked with a file enabling them to be easily broken in the fingers without fragments. They contain from 14 to 15 grains of calcium hypochlorite. This chemical contains from 30 to 32 per cent chlorin, which forms in the water hypochlorous acid and results in sterilizing the water. The process is one of oxidation. In the strength used waters highly infected are rendered safe. Of course, in such strengths (1–500,000) grossly polluted water such as sewage will not be rendered safe. Water ordinarily used will be entirely safe after being so treated. As the chemical acts more efficiently in clear waters, a filter-cloth, to be fastened over the opening of the bag and weighing 1 ounce, is provided, or water may be strained through a blanket. The bag is filled after it is in place. Suspended matter, such as clay, is largely removed and not left to interfere with the action of the chlorin.

Comprehensive experiments demonstrate the bacteriological efficiency of the appliance. The organisms causing typhoid fever, the dysenteries, including amœbic or tropical dysentery, and ciliates are promptly destroyed. Even in the vegetative form amœbæ are killed in 15 minutes—ordinarily 5 to 10 minutes suffices after the addition of the powder to render the water safe to drink. Exposure of 30 minutes has been found to destroy all amœbæ and ciliates under most severe conditions in a test.

4. *Disposal of garbage.*—For detachments or companies in camps, or in isolated locations where other means are not available, the incinerator shall be installed.

If wood is plentiful and medium-sized stones can be obtained, both liquid and solid refuse can be disposed of by using incinerators improvised for each company as follows:

A pit is dug about 5 feet long, 2½ feet wide, and 6 inches deep at one end and 12 at the other; the excavated earth is banked around the pit and the latter is then filled with stones on which a fire is built; when the stones have become heated liquid refuse is poured into the pit (shallow end) where it gradually evaporates; solid matter is burned on the fire.

The efficiency of this type of incinerator depends largely upon the fact that porou earth absorbs a very large part of the liquid slops, but it is not considered practicabl to destroy the usual accumulation of slops every day without using an extravagan amount of fuel.

A type of incinerator having a fire bed of rock 1 foot deep will not permit the hea from the fire to penetrate beyond that depth. The rock wall on three sides of th fire bed absorbs much heat that otherwise might be dissipated into space, whic increases the evaporating capacity of the incinerator enormously, and requires comparatively very small amount of fuel. Incinerators built of large rocks are cor sidered to be most efficient.

About one-sixth of a cord of wood per day per company is considered more tha sufficient for the destruction of all slops and garbage, if ordinary care and attentio is given the incinerator. Liquid slops should be evaporated by being poured slowl along the vertical walls of the incinerator, not upon the fire bed, and the solid garbag should be placed on top of the fuel. It has been determined that a skilled attenda can destroy 100 gallons of liquids and 23 cubic feet of solid garbage in about 12 hou by using one-sixteenth of a cord of wood.

Where rock is not available, material (brick, 340; lime, three-fourths bag) will obtained on requisition from the quartermaster. Where disposal in a sanitary wa can be made by means of carts, the garbage can may be used. The cans shall be tho oughly cleaned, scalded and coated with crude petroleum after emptying.

5. *Disposal of manure and care of picket lines.*—All manure shall be hauled to t camp dump. Picket lines shall be kept broom swept and all manure and straw haul off daily. A weekly incineration of the picket lines shall be cccomplished wi crude oil at the rate of 10 gallons to each line. Crude oil may be obtained from t Quartermaster Corps on usual requisition.

6. *Disposal of excreta.*—Where a water carriage system is not feasible, the Havard box shall be used over the earth latrines. Daily inspections of this system are enjoined on the part of the medical officer of the organization, who will see that the following plan is carried out:

(*a*) The latrine shall be burned out thoroughly with crude oil and hay twice a day. (Each burning, 1 gallon crude oil and 7.5 pounds of hay, or straw.)

(*b*) The boxes shall be at all times kept fly-tight; this implies closure of all cracks and care of the hinges and a back construction so that the lids drop automatically. The latrine seats shall be washed off twice weekly with a 1 to 100 solution of cresoline, or other disinfectant, and whitewashed inside twice weekly.

(*c*) Latrines shall be rebuilt when filled to within 2 feet of the top.

(*d*) Where water-carriage system is in vogue, either the automatic flush or trough system shall be installed.

7. *Kitchens and mess rooms.*—Kitchens and mess rooms shall be securely screened and an efficient fly trap provided for catching such flies as gain entrance thereto. An effective fly trap consisting of a light wooden frame, covered with wire gauze, extending to about one-eighth of an inch of the floor of the trap, is readily constructed. It has been found that sweetened water, slightly acidulated with vinegar, is an excellent bait.

Ice boxes installed shall be inspected daily and drip pans emptied and scalded out.

Garbage cans shall be kept on wooden racks and elevated from the ground, and cans burned out daily with oil to prevent fouling, and kept clean outside with a coat of whitewash.

8. Arrangements shall be made for the installation of shower baths for all troops and a careful inspection shall be made daily to see that waste water therefrom is so disposed of as to prevent mosquito breeding.

9. The use of the mosquito bar is imperative and it shall be used in all districts where mosquitoes are prevalent.

10. *Food and drinks.*—No food, drinks, or like commodities will be sold in camp except in the authorized exchanges.

Attention is called to the use of the following foods, the elimination of which from the messes will serve to prevent a variety of intestinal disorders:

(*a*) Canned milk and fish opened the day before. (Fish and milk poisoning.)

(*b*) Hashes of meats and potatoes prepared the night previous. (Ptomaine poisoning of severe type.)

(*c*) Locally grown green vegetables, uncooked. (Dysenteries and diarrhea.)

11. *Malaria.*—When malaria prevails, the daily use of three grains of sulphate of quinine, to be increased as indicated, as a malarial prophylactic is made compulsory.

12. *Inspections.*—Surgeons of organizations shall make a daily inspection of the commands to which they pertain, covering the following: Picket lines, latrines, kitchens, barracks, inclosed toilets, baths, garbage receptacles, incinerators, and all food supplies; they shall make a verbal report at once to their respective commanding officers for the correction of any sanitary defects noted, and a similar report, with the action taken, to the sanitary inspector on his next visit.

13. A special report shall be made at once by the surgeon of each organization to the sanitary inspector for the information of the chief surgeon, in the following cases:

(*a*) Acute infectious or contagious diseases developing in barracks or camps.

(*b*) Cases of fever of 101° or over, attended with albuminuria.

(*c*) Unusual prevalence of mosquitoes in vicinity.

(*d*) Development of amœbic or bacillary dysentery or malaria in the command.

14. Venereal prophylaxis and venereal inspections shall be carried out thoroughly and the required monthly report of the number of new cases of venereal diseases shall be sent to the chief surgeon, through the sanitary inspector, each month.

15. Areas about camps in which mosquitoes could breed, such as cisterns, tanks, woods, gutters, pools, and drains shall be kept under close observation by the surgeon, and the proper remedies applied, i. e., screening, draining, oiling, etc.

16. Sanitary squads composed of medical officers, noncommissioned officers, and privates of the Medical Department will be organized by the chief surgeon. The sanitary squad will supervise and assist in the disposal of camp wastes. Civilians employed as sanitary laborers will be employed by the Quartermaster's Department and turned over to the Medical Department.

The sanitary police officer will make requisition on the Quartermaster General for such transportation, labor, material, etc., as may be needed. When assigned to this service they will not be diverted to other uses except by competent authority.

17. *Flies.*—All possible breeding places of flies, accumulations of wastes and filth, should be destroyed by incineration and particular attention given to the manure and refuse from the picket lines and stables.

An energetic campaign must be begun at once against the mature flies.

Each company or organization will provide itself with several large flytraps, to be placed near kitchen doors, store tents, and wherever flies are present.

INFECTIOUS DISEASES.

Certain infectious diseases are of primary importance in military sanitation and will be mentioned briefly in the following notes:

Typhoid fever.—Is caused by a specific organism, the bacillus typhosus. When the bacillus finds an entrance into man's intestinal tract typhoid fever is likely to result.

The excreta, and particularly the stools of the victim of typhoid, and his urine are loaded with the typhoid bacilli. Hence the necessity for extreme care in properly disposing of excreta, and the strict avoidance of camp pollution.

Typhoid fever, like cholera, is due to the transference of fecal matter of the infected individual, either directly or indirectly, to the alimentary canal of another nonimmune person.

Typhoid fever is, therefore, chiefly a filth disease and one widely distributed over the world. Its presence in a camp or community is chiefly determined by the personal cleanliness of the occupants, and largely by their method of disposing of human excreta.

Through careless means of disposing of feces and urine, water, milk, and food become infected, very largely through the agency of insects, principally the fly, which, breeding in accumulations of refuse, manure, and various forms of filth, transfer the disease germ mechanically on their bodies and in their secretions from the infected source to the food. Absolute protection of food supplies of all kinds and persistent warfare on the fly are imperative.

The most common mode of infection in typhoid, as was shown in the camps of 1898, was by contact, direct or indirect, with the infected individual. About 60 per cent of all cases, as shown by investigations, are believed to be due to contact infection.

Direct contact infection follows intimate association with the infected person.

Indirect contact infection results from clothing, bedding, drinking cups, food, dishes, etc., which may serve to carry the infection from one person to another.

The necessity for great care as to personal cleanliness is obvious.

Frequent bathing, the washing of hands before eating, attention to laundering underclothing, and general personal cleanliness are obligatory, as well as the prompt sterilization of all articles which have been used by those suffering from the disease, as well as by "carriers," those excreting typhoid bacilli, though presenting no active symptoms of the disease.

These "carriers" are an insidious menace, an even greater one than a frank case o typhoid fever, because so frequently unrecognized. The greatest precautions mus be taken by sanitary officers for the prompt recognition, isolation, and treatment o these "carriers."

The regulations direct that all soldiers, immediately on entrance into the service be protected against typhoid fever by vaccination, as well as against smallpox. Thi regulation will be strictly enforced.

Malaria.—Is caused by a microorganism (the plasmodia malariæ) which gain access to the body through the bites of mosquitoes belonging to the genus anopheles

The predisposing causes of the disease are those that favor the development o mosquito life.

On account of the nocturnal habits of the malaria-bearing mosquitoes, the diseas is more likely to be contracted at night.

Camps will not be located near swamps or in places where standing water favo the development of the mosquito. Every precaution will be taken to destroy thes breeding places by draining and filling, or by oiling them and by the cutting awa of all grass or undergrowth for a distance of 200 yards about camps and habitations order that the adult mosquitoes may not find lodgment and protection there.

Since the malaria mosquito is chiefly a night biter, the regulation requiring th use of the mosquito bar at night will be rigidly enforced and frequent inspectio made to see that no evasion of this order occurs.

In certain conditions the use of preventive doses of quinine may be required an administered by order under the supervision of the medical officer. All cases malaria will be promptly isolated for treatment and protected from attacks mosquitoes.

Yellow fever.—Is transmitted by the bite of the yellow-fever mosquito (the *Steg myia calopus*), as proved by Maj. Walter Reed, Medical Corps, United States Arm in 1900.

Yellow fever is essentially a disease of the Tropics, and its existence is entirely dependent upon the distribution of this single species of mosquito, small and silver striped, active principally at evening time, and breeding generally in small accumulations of water close to the habitations of man.

The prevention of this disease, as in malaria, depends chiefly on the destruction of the mosquito and its breeding places, the proper protection against the bites of the insects at all times, and the early isolation, protection, and treatment of each case of yellow fever as soon as suspected.

Cholera.—Is an acute infectious disease caused by a comma-shaped microorganism—the cholera bacillus.

These germs breed in the intestines of man and find their way into the mouth of another individual through the medium of infected water, milk, and food; or the germs can be conveyed by carriers—by flies—and by contact infection, as in typhoid fever.

In every case this connection is certain and absolute. The disease extends in no other manner.

In the cholera patient practically the only infected discharge is the stool. It is therefore essentially a filth disease.

As in typhoid fever, contaminated food, dirty hands, flies, and infected clothing and bedding are frequent sources of danger. All the sanitary precautions used in the prevention of typhoid fever should be exercised, including the careful searching out of carriers—those individuals having the germs of cholera in their intestines and excreting them in their stools, thus scattering the infection and unknowingly infecting those about them and greatly assisting in the rapid spread of the disease.

These "carriers" in an infected district are often numerous, ranging in numbers from 5 to 10 per cent of the apparently normal population in a community where an epidemic prevails. "Carriers" are specially dangerous if connected in any way with the handling of the food supply.

In cholera, as in typhoid fever, dysentery, and other so-called diarrheal diseases, great care should be exercised to provide that—

(1) Only sterilized water is used.

(2) Only recently cooked and properly served food is allowed.

(3) All kitchens are screened.

(4) All refuse is burned and constant warfare made against the fly and its breeding places.

Anticholera vaccination has been proved an effective preventive measure also, but again, as in typhoid fever, the application of vaccination in these diseases does not lessen in any degree the responsibility or importance of rigidly enforcing all the general sanitary rules which have been here briefly stated.

Dysentery.—Under this head are included at least two severe specific diseases—bacillary dysentery and amebic dysentery—each caused by distinctive organisms.

In addition there may be mentioned under this heading all the various forms of diarrhea and colitis characterized by colic, bloody stools, and tenesmus.

Some of these are undoubtedly of a nonspecific and temporary nature, due to chill or to indiscretions in eating and drinking.

Prevention is the same as in typhoid fever and cholera, since there is no doubt that in the specific bacillary and amebic dysenteries the cause of the infection leaves the infected man by his excreta, largely in his feces.

Attention is again directed to what has already been said, to the great importance of strict attention to the disposal of all excreta and wastes, and to the careful investigation and protection of the water supply.

The three diseases, typhoid fever, cholera, and dysentery, may from the standpoint of prevention be considered as forming a well-marked group.

In all the mode of departure from the infected man is in his dejecta, in all it enters the infected man in food and drink, and in all three the fly very often provides the most important link.

Typhus fever.—Is an acute infectious disease caused by a specific germ, characterized by sudden onset, high fever, marked nervous symptoms, and macular eruption. It has prevailed in Mexico since the middle of the sixteenth century.

Typhus fever is transmitted to man only by the bite of the louse, which infests the body and clothing of the victims.

The prevention of typhus fever depends, therefore, upon personal cleanliness and the avoidance and destruction of infected lice.

Frequent bathing and cleansing of clothing, with repeated inspections of garments, particularly the seams, where the eggs of the louse are deposited, are imperative precautions.

The body louse lays its eggs among and attached to the fibers of clothes, with a special preference for seams and linings, a point to be remembered in the destruction of lice.

These eggs are the size of a small pinhead, yellowish white in color, goblet-shaped, and attached at the lower end to the cloth by a cement excreted by the female. They can be destroyed with boiling water or kerosene.

The avoidance of buildings, places, and persons known to be infected with lice is of first importance.

In case troops are sent into a typhus area, a railway disinfecting and bathing train will be provided and stationary plants of like character established at the bases.

Smallpox.—All soldiers will be vaccinated against this disease on enlistment. Vaccination confers immunity against smallpox for a number of years.

Any case occurring among recruits will be isolated, and contacts not protected by recent successful vaccination will be revaccinated.

Epidemic cerebro-meningitis.—Preventive measures in this disease consist of prompt recognition, isolation, and treatment of the patient.

"Carriers" will be also carefully sought for and kept under close observation.

Measles, mumps, and scarlet fever.—When these diseases appear in a command all cases will be immediately isolated, all "contacts" inspected daily, and, where the diseases show a tendency to spread, a detention camp will be established, where all recently arrived recruits will be detained under observation for a period of 12 days before being permitted to join their organizations.

Venereal diseases.—The cause of these diseases is a matter of common knowledge. They are entirely preventable, and the Government punishes those who expose themselves and contract venereal disease by prompt stoppage of pay and restriction of privileges while under treatment.

All preventive measures prescribed by Army Regulations against infections of this character will be rigidly enforced.

WATER SUPPLY.

The complaints as to insufficient and unpotable water supply at the various posts, mentioned in the last annual report, have been, in the main, remedied, and those made during the year 1915 will, it is believed, be satisfactorily adjusted by the appropriation of funds necessary to make such necessary alterations as will insure an adequate and potable supply.

In connection with the "Bags, water, sterilizing" placed upon the supply table, mention of which was briefly made in the last report of this office under this caption, it is considered meet to mention the highly satisfactory results obtained, as evidenced by the reports reaching this office, by the troops serving in the United States, as well as those making up the punitive expedition into Mexico, in the use of the bags in question.

Too much credit can not be given Maj. William J. L. Lyster, Medical Corps, the officer who devised this most useful article of equipment. During the last year certain improvements have been made in the original bag which, judging from the reports of trials, stamps it at once as an indispensable article of equipment. Among the more important merits which the bag possesses may be mentioned:

1. Its portability, thereby making it adaptable for use by small commands segregated by necessity from the main column of troops.

2. Simplicity of operation, thus insuring prompt and efficient service and a supply of potable water, not raised in temperature, whenever the demand arises.

3. Availability of potable water, obviating the desire to quench the thirst at streams, irrigation ditches, etc., on the march, since the canteen is sterilized and the filling of it supervised by those competent to determine potable water.

4. The lessening of the possibilities for ingesting, through unsterilized water, of organisms causing typhoid fever, the dysenteries

including amœbic or tropical dysentery, thus making for a minimum sick rate and for a greater efficiency among the troops.

The hypochlorite of calcium used as the sterilizing agent in connection with the bag is put up in hermetically sealed glass tubes and the tubes packed in a corrugated paper container, making a light, portable package, with little or no weight added to the pack on the soldier's back. The containers being made of corrugated paper will stand much rough usage without danger of breaking the tubes and robbing them of its active agent—chlorin.

BARRACKS AND QUARTERS.

Attention is again invited to the matter of overcrowding at the recruit depots, particularly at Jefferson Barracks, Mo., and Columbus Barracks, Ohio. Crowding adds to the ready spread of infection, especially during the winter months, when the morbidity and mortality rates for measles have been rather high. Too much emphasis can not be laid on the evil results of crowding at this time of the year, when the recruiting is augmented, and with the prospect of an increased volume of recruits in the future this defect should be remedied. It has proven such a serious defect not alone in causing temporary suspension of the work at the depots, but in causing a very large number of deaths among young men contractng measles and other contagious diseases who had reported at the depots in robust health.

During the summer months, when an open-air life is permissible, the question is not so vital; but when climatic conditions are unfavorable and infections so rife and of such increasing virulence as experienced during the winter months, at which time recruiting is so much increased in volume, crowding is a most serious defect and should, for the best interests of the recruit depots, be reduced as much as possible, even if necessary to move the permanent peronnel, as has been done in the past when an epidemic threatened.

It is believed that the expense of added buildings would, in the ong run, prove a great saving in reducing the disability and morality incident to overcrowding and the resultant spread of infection.

CLOTHING.

There has been no change in the clothing to be worn as provided for n Uniform Regulations since the last report. However, owing to he scarcity of materials it has been found necessary to make some change in the fabric used in the hat, this with the idea of meeting abnormal conditions in the National Guard.

A board of officers with the punitive expedition in Mexico give it as heir opinion that the present cuff legging is not a success and urgently ecommended the return to the legging similar in shape to that used n 1898, with certain parts reinforced with leather for the Field Artillery and Cavalry.

Several recommendations have been submitted from various ources to do away with the high collar on all of the coats, more especially in the Canal Zone, and adopt for the officers in particular collar similar to that worn by the British officers, and for the men turn-down collar similar to the old blouse collar worn before 1898. No definite action has, however, been taken on any of these recommendations.

UNITED STATES MILITARY ACADEMY, WEST POINT, N. Y.

The surgeon at West Point reports as follows on health conditions, etc.:

Corps of cadets.—The health of the corps has been excellent throughout the year. There were 579 hospital admissions during the year, equivalent to an annual admission rate of 1,000 per thousand, a decrease of 127 per thousand as compared with the preceding year; this is the smallest admission rate recorded during the past 10 years. The noneffective rate, or the number of cadets constantly in hospital, was 13.82 per thousand, as compared with 19.83 per thousand in 1915; this is the smallest rate during the past 10 years except in 1914, when it was 11.92. The average number of days' treatment of each case was 5, as compared with 6.4 for the preceding year, 4 days for 1914, and 4.8 for the preceding four years. The following table shows the hospital-admission rates and the noneffective rates per thousand for hospital cases for the past 10 years.

TABLE I.—*Admissions.*

Year.	Mean actual strength command.	Cases.	Rates per thousand.	Noneffective rates per thousand hospital.
1906–7	440	682	1,550	35.2
1907–8	404	641	1,586	32.1
1908–9	422	992	2,350	32.7
1909–10	417	987	2,366	35.7
1910–11	407	780	1,916	28.2
1911–12	531	764	1,438	17.7
1912–13	515	587	1,139	16.8
1913–14	562	612	1,088	11.9
1914–15	612	690	1,127	19.8
1915–16	579	579	1,000	13.8

There were no cases of critical illness nor of dangerous injury under treatmen during the year. A mild but extremely contagious epidemic of influenza occurre during December and January, lasting about one month and affecting about 16 pe cent of the corps; 108 cases were admitted to the hospital for treatment, the averag duration of each case being about four days; there were no serious complication Forty-one cases of contagious catarrhal conjunctivitis were treated in hospital durin the year. None of the cases were at all serious. One case of laryngeal tuberculosi occurring in a cadet on furlough, was transferred to Fort Bayard, N. Mex. Fiv cases of malaria appeared during the year, one a new case and four recurrences fro previous infections. Three cadets were discharged for physical disability, for valvul disease of the heart; one case followed an attack of articular rheumatism, in line duty; the other two occurred previous to entrance into the Military Academy.

Of the 579 hospital admissions, general diseases, including 108 influenza, furnish the greatest proportion, 135, or 23.31 per cent; injuries and other affections due external causes furnished 132, or 22.79 per cent; diseases of the digestive system 9 or 16.58 per cent; diseases of the respiratory system 79, or 13.64 per cent; and diseas of the eye and ear, including 41 cases of conjunctivitis, 56, or 9.65 per cent.

Of the 132 affections due to external causes, the greatest proportion were as usu due to accidents during riding; the next most frequent were due to football, to gy nastic exercises, to badly fitting shoes, to basket ball, and to baseball, as follows:

TABLE II.

	1915
Accidents during riding	43
Injuries due to football	25
Accidents during gymnastics	17
Injuries from badly-fitting shoes	7
Injuries due to basket ball	4
Injuries due to baseball	7
Miscellaneous accidents and injuries	29
Total	132

The football season was marked by an unusually small number of accidents, most of them of a trivial nature, no injury being permanent. Twenty-five cases required hospital treatment entailing an absence of 159 days from duty, as compared with 36 cases and 221 days lost in hospital during the preceding season. The freedom of football players from serious accidents is gratifying and is to be attributed to the fine physical condition of the members of the squad when active fall practice is begun and also to the careful oversight on the part of the medical officer on duty with the squad and of the coaching staff. Accidents are far more likely to occur when a player begins to tire and when the fine edge of mental and physical fitness has begun to turn. If at that point the player is taken out of the game most of the serious accidents of football may be avoided. This is the policy which is followed at the academy and which has given excellent results.

The following table shows the number of football injuries during the past nine years and the number of days lost by treatment in hospital:

TABLE III.

Year.	Number of cases.	Days lost in hospital.	Average days per case.
907	25	117	4.6
908	62	362	5.8
909	34	174	5.0
910	27	210	7.7
911	34	169	4.9
912	35	259	7.4
913	28	157	5.6
914	36	221	6.1
915	25	159	6.3

In the last annual report from this office, mention was made of the fact that badly-itting shoes were the cause of much foot trouble, particularly in the fourth class during ummer camp. An effort was made to prevent these troubles in the incoming class y requiring that all new cadets be measured and that shoes of proper size be issued n accordance with the detailed instructions prescribed by the War Department for itting enlisted men. The practical results of this scheme have been exceedingly atisfactory. Capt. H. C. Coburn, jr., Medical Corps, on duty with the corps during heir week's practice march in August, reported as follows:

"In closing this report I desire to call especial attention to the exceedingly small umber of foot injuries treated on this march. Only eight cadets reported to the ospital during the entire week on account of blisters or corns due to marching and hese were all of such a trifling nature that no duties were missed. I consider this xcellent showing due to the good work done this year in accurately fitting the fourth lass with shoes of proper size immediately upon admission to the academy. Last ear many cadets reported daily with foot trouble, the bulk being made up of fourth lassmen with all forms of injuries due to short shoes. The improvement this year as very noticeable and it is hoped that the good results may be perpetuated by the ame careful supervision of footwear as was practiced this summer."

A minimum standard of vision has been fixed by the War Department for graduation t the Military Academy. The vision "shall not be less than 20/100 in one eye and 0/70 in the other, these defects to be entirely correctable by proper glasses." This s in accordance with the recommendation of Maj. S. H. Wadhams, Medical Corps, ho was detailed by the War Department to make a special study of visual defects mong cadets at the academy.

3. *Enlisted men.*—During the past year there were 231 admissions to sick report, quivalent to an admission rate per thousand of 326, the lowest on record in recent ears. The noneffective rate was also lower than in 1915, being 7.9 per thousand as mpared with 9.35 for 1915. Both the admission and the noneffective rates are very nsiderably lower than for the Army at large. The following table shows the number admissions, the admission rate and the noneffective rate per thousand among enlisted en for the past six years:

TABLE IV.

	1911	1912	1913	1914	1915	1916
lmissions to sick report	622	401	415	302	359	230
ites per thousand (admission)	825	626	603	468	501	328
neffective rates	18.87	14.81	15.26	11.25	9.35	7.91
an annual strength of command	649	648	688	702	716	706

The number of admissions for transmissible diseases was small, including venereal, 28; influenza, 25; malaria, 3; tuberculosis, 3. The three cases of malaria reported were recurrent attacks; the three cases of tuberculosis were transferred to Fort Bayard, N. Mex., for treatment. No case of pneumonia was reported during the year.

4. *Civilian population.*—Health conditions among civilians attached to this command have been very satisfactory. A mild epidemic of mumps occurred during December and January among the children of officers and enlisted men, numbering 42 cases; 9 cases of measles were reported during the year, 3 of chicken pox, and 1 of whooping cough.

5. *Sanitation.*—The sanitary conditions of the post have been excellent throughout the year. The stringent measures against mosquito and fly breeding heretofore adopted have been successfully carried out. Only eight cases of malaria occurred during the year, of which seven were recurrences of previous infection. Five cases were among cadets, equivalent to an annual admission rate of 8.6 per thousand, the lowest on record except in 1914; three cases were among enlisted men, an equivalent rate of 4.2 per thousand. The admission rates for malaria for cadets and enlisted men are shown in the following table:

TABLE V.

ALASKA.

The mean strength of the troops, officers, and enlisted men serving in Alaska during the past year was 787, as compared with 958 in 1914. This force consisted of Infantry, Signal Corps, and Hospital Corps, all white. Alaska still remains the healthiest region in which the Army is stationed.

The admission rate for all causes was 378.65 per 1,000 in 1915, as compared with 408.14 in 1914. The rate for disease was 292.24 per 1,000, and that for external causes 86.40, as compared with 303.76 and 104.38, respectively, in 1914. The corresponding rates for the United States were, for total causes, 696.04 per 1,000; that for disease being 559.43, and that for external causes, 136.61. The diseases having the highest admission rates are shown in the following tabulation:

Admission rates for some of the principal diseases for Alaska, American troops, officers and enlisted men.

	Total officers and enlisted men.		Enlisted men.	
	1915	1914	1915	1914

PHILIPPINE ISLANDS.

AMERICAN TROOPS (ENLISTED MEN).

By reference to the figures furnished below it will be noted that no marked improvement in the health of the American troops serving in the Philippine Islands resulted during 1915 when compared with the figures for 1914. While the rate for venereal diseases (all) compared favorably with the admission rate for 1914, these diseases still remain a matter of concern. The admission rate for malarial fever has taken a remarkable jump, compared with the rate prevailing for that disease during 1914, being 45.26 for the latter and 63.12 per 1,000 for 1915.

The mean strength of the enlisted American troops stationed in the Philippine Islands for the year was 11,834 (S. G. O.). Of this number 10,493 were white and 1,341 colored. The statistics for the Philippine Scouts, of whom there were 5,505, will be given separately.

ADMISSION RATES.

During the year there were 11,721 case admissions for all causes, white and colored troops, making a case admission rate of 990.45 per 1,000, as compared with 8,999 case admissions and a case admission rate of 877.69 per 1,000 for 1914, 922.06 for 1913, and 1,246.99 for1912.

The case admission rate for disease only was 871.05 for 1915, 746.61 for 1914, 776.28 for 1913, and 1,075.34 for 1912.

The case admission rate for white troops for all causes was 954.35, as compared with 1,272.93 for colored troops, the latter having a mean strength of 1,341 during the year.

The case admission rate for injuries for white troops was 120.08 per 1,000 as compared with 114.09 per 1,000 for colored troops, and for the total American troops, white and colored, 119.40 per 1,000, the lowest rate for several years.

CONSTANTLY NONEFFECTIVE RATES.

The total constantly noneffective rate for the year was 29.15 per 1,000; that for white troops being 28.20 and for colored, 36.57.

The total noneffective rate for disease only in 1915 was 25.42 per 1,000, as compared with 24.62 for white troops and 31.73 for colored. The rates for 1914 were 26.60, 27.29, and 23.56 per 1,000, respectively.

DISCHARGE ON CERTIFICATE OF DISABILITY.

The American soldiers are very rarely discharged in the Philippine Islands, being invalided home and discharged in the United States; however, those so discharged are credited to the Philippines. Table No. 28 shows the diseases for which these discharges were made.

The discharged rate for 1915 was 23.22 per 1,000 as compared with the corresponding rate of 10.62 for 1914. The rate for disease only was 22.04 per 1,000, and that for injury, 1.18, as compared with the corresponding rates of 10.24 and 0.38 for 1914. The total rates for the white troops was 23.79 as compared with 18.64 per 1,000 for the colored troops.

The diseases causing the highest number of discharges were: Mental alienation, with a rate of 7.99; tuberculosis, 3.28; flat foot, 2.27, and venereal diseases, 0.93. The corresponding rates for the United States were 2.54, 1.67, 1.19, and 0.88 per 1,000, respectively.

DEATHS.

Deaths occurring in the United States in the persons of those invalided home from the Philippine Islands are credited to that station.

There were 36 deaths among the American troops, officers and enlisted men, during the year 1915, 34 of which were enlisted, white and colored; 20 from disease and 16 from injury, the total death rate being 2.87 per 1,000; that for disease 1.59 and for injury 1.27 per 1,000. The figures here given are taken from Table No. 29 and are for officers and enlisted men. The figures slightly differ from those given in Table No. 72 at the back of the report, which are for enlisted men only. The total death rate, officers and enlisted men, for 1914 was 3.64 per 1,000; that for disease being 1.95 and for injury 1.69 per 1,000. There were 3 deaths from drowning in 1915, as compared with 4 in 1914. Six suicided in 1915 as against 2 in 1914.

Tuberculosis caused 6 deaths in 1915 and 4 in 1914; dysentery, 2 in 1915 and 1 in 1914; alcoholism, no deaths in 1915 and 2 in 1914.

TABLE NO. 29.—*Causes of death, American troops, Philippine Islands, year 1915, officers and enlisted men.*

Causes of death.	Number of deaths.	Ratio per 1,000 of— Mean strength.	Ratio per 1,000 of— Deaths from disease.

PREVALENCE OF SPECIAL DISEASES, AMERICAN TROOPS (ENLISTED MEN).

TYPHOID FEVER.

None occurred in 1915 or in 1914 and 1913.

MALARIAL FEVERS.

The admission rate for all fevers of this class was 63.12 per 1,000 as compared with 45.26 in 1914 and 112.08 in 1913. The rates for American and native troops are shown graphically in charts X and Y.

By reference to Table No. 31 it will be seen that Camp Stotsenburg had the highest admission rate for American garrisons, 121.18 per 1,000, as compared with 81.12 in 1914. Camp Eldridge, last year stood in second place, this year has dropped down to No. 4. Fort Mills, which was No. 7 on the list in 1914, now takes second place with a rate for 1915 of 88.48, compared with 31.75 per 1,000 in 1914. In this connection it should be noted that the posts garrisoned with ative troops have considerably higher admission rates than those garrisoned with American troops.

ABLE No. 31.—*Malarial fevers, year 1915, compared with year 1914, for stations in the Philippine Islands.*

Posts.	Ratio per 1,000 of mean strength.	
	1915	1914
rincipally of American troops:		
Camp Stotsenburg	121.18	81.12
Fort Mills	88.48	31.75
Regan Barracks	37.15	39.77
Camp Eldridge	32.44	75.47
Fort Santiago and headquarters of Philippine Department	27.62	15.62
Fort William McKinley	17.95	33.28
Camp McGrath	12.40	16.97
Cuartel de Espana	10.01	72.84
rincipally of Philippine Scouts:		
Ludlow Barracks	213.42	778.49
Camp Overton	110.09	75.47
Camp Gregg	70.06	247.01
Pettit Barracks	62.90	150.48
Augur Barracks	57.42	178.90
Fort San Pedro	56.38	183.95
Camp Keithley	43.35	62.62
Camp Nichols	26.79	17.73
Warwick Barracks	21.65	152.50
Camp John Hay	13.13	37.27

UNDETERMINED FEVERS.

The admission rate for these fevers during 1915 was 4.31 per 1,000 s compared with 4.39 in 1914, 5.27 in 1913, and 15.46 in 1912. The arious diagnoses under this head are:

ebricula	27
evers, simple, continued	33
ever, type undetermined	30
Total	90

The diagnoses given above are for officers and enlisted men, American troops, and Philippine Scouts.

SMALLPOX AND VARIOLOID.

No cases occurred in the islands. One case developed in a casua transferred from a transport en route to the United States.

VENEREAL DISEASES.

Notwithstanding vigorous efforts made by the authorities and the carrying out of the provisions of G. O. 31, 1912, and G. O. 45, 1914 venereal diseases still hold first place for both admission and noneffective rates. Of the total admissions for the year over one-fift were due to venereal diseases. There were 482 admissions fo syphilis, 450 for chancroid and 1,273 for gonorrhea. Of the tota noneffective rate for disease, 25.42 per 1,000, venereal diseases alon contributed a rate of 8.10 during 1915 as compared with 10.41 in 1914

The following tabulation shows the admission rates and their cause for the enlisted personnel serving in the Philippines during 1915:

Venereal diseases, Philippine Islands (enlisted men).

	Syphilis.	Chancroid.	Gonorrhea.	Total venereal
White troops:				
1915	37.93	38.79	100.35	177.
1914	47.28	47.40	80.11	174.
Colored troops:				
1915	62.64	32.06	164.05	258.
1914	48.46	89.46	95.85	233.
All American troops (enlisted):				
1915	40.73	38.02	107.57	186.
1914	47.49	55.10	83.00	185.

TABLE NO. 32.—*Venereal diseases among officers and enlisted men at posts in the Phi ippines having strength of more than 300 men, year 1915.*

Posts.	Admissions.		Mean strengt
	Total.	Ratios.	
Principally American troops:			
Regan Barracks	230	356.04	
Camp Eldridge	164	312.98	
Camp Stotsenburg	433	213.30	2,
Camp McGrath	148	203.86	
Cuartel de España	175	194.66	
Fort William McKinley	572	190.15	3,
Fort Mills	416	88.90	4,
Principally Philippine Scouts:			
Augur Barracks	78	93.30	
Fort San Pedro	23	68.25	
Camp John Hay	18	33.77	
Warwick Barracks	11	23.81	
Pettit Barracks	9	18.87	
Ludlow Barracks	13	14.30	
Camp Keithley	9	13.93	
Camp Overton	3	6.88	

ALCOHOLISM AND ITS RESULTS.

The admission rate for this disability for 1915 was 18.08 per 1,000 as compared with 22.14 in 1914, a considerable reduction when considering the increase in this rate in 1914 over that for 1913.

The noneffective rate was 0.21 per 1,000 as compared with 0.34 in 1914. The rate for white troops was 0.22 and that for colored 0.14, the former having 197 admissions as against 17 for the colored troops.

CHOLERA.

No case of cholera reported among the American troops during 1915.

TUBERCULOSIS.

Seventy-six cases of tuberculosis occurred among American troops, making a ratio of 6.42 per 1,000 All of these cases were transferred to the United States. Of the 6 deaths reported all occurred in the cases invalided home. In 1914 there were 75 cases of this disease, with an admission rate of 7.31 per 1,000, with 3 deaths.

BERIBERI.

No case occurred among American troops.

DYSENTERY.

A marked decrease in the incidence of this disease is noted for 1915, but 63 cases occurring with an admission rate of 5.32 per 1,000, as compared with 133 cases with a ratio of 12.97 in 1914. Of the 63 cases reported, 2 were bacillary, 58 entamoebic, and 3 cases unclassified. The entamoebic dysentery gives an admission rate of 4.90 per 1,000.

The noneffective rate for dysentery (all) was 0.31 per 1,000 for 1915, as compared with 0.76 for 1914.

DENGUE.

This disease, which appeared in epidemic form at seven posts in the islands, had the second highest admission rate as well as the second highest noneffective rate, being 131.31 and 1.94 per 1,000, respectively, as compared with 33.16 and 0.55 per 1,000, respectively, in 1914. One thousand five hundred and fifty-four cases in all were reported during the year. No discharge or death, however, resulted in this number of cases.

MENTAL ALIENATION.

There were 86 admissions for mental alienation in 1915, with an admission rate of 7.27 per 1,000. In the United States the rate was 3.04 per 1,000. In 1914 the rates were 6.24 for American troops in the Philippine Islands and 3.83 in the United States.

DIARRHEA AND ENTERITIS.

A marked reduction over 1914 is noted in the cases of this disease, being 449 in 1915 as compared with 647 in 1914. The admission rate per 1,000 in 1915 was 37.94; in 1914 it was 63.10; in 1913, 67.48; and in 1912, 60.69.

The noneffective rate for 1915 was 0.51 as compared with 0.91 per 1,000 in 1914, being a marked improvement over the rate for 1913, when it was 1.14.

TYPHUS FEVER.

No case of this disease occurred among the American troops. Three cases, however, were reported in the native troops from Camp Keithley.

INVALIDING TO THE UNITED STATES.

The disease causing the highest number of men to be invalided home were, with actual numbers: Tuberculosis, 93; mental alienation, 93; flat foot, 50; epilepsy, 18; syphilis, 17, and neurasthenia, 12.

TABLE NO. 33.—*Enlisted men invalided home from the Philippine Islands, year 1915.*

INFLUENCE OF SEASON.

The highest admission and noneffective rates (all causes) occurred in July, being 116.65 and 33.59 per 1,000, respectively. Likewise, exclusive of injuries, venereal diseases, alcoholism, and vaccinia, which are not influenced by season, July had the highest admission rate, 88.33, with August running a close second, 87.82.

PHILIPPINE SCOUTS.

The health of the troops (native) in the Philippines for the year 1915 was very good, being a marked improvement over that for the year 1914. The mean strength of these troops during the year was 5,505, as compared with 5,020 during 1914.

ADMISSIONS.

During the year there were 3,159 admissions for all causes, with a case admission rate of 573.84 per 1,000, as compared with 3,585 admissions and a case admission rate of 714.14 per 1,000 for the year 1914.

The rate for disease for 1915 was 482.65 and that for injury 91.19 per 1,000 as compared with 618.33 for disease and 95.82 for injury in 1914.

The following tabulation gives the admission rates for some of the principal diseases in 1915 as compared with the year 1914:

	1915	1914
alarial fevers	80.11	201.80
iarrhea and enteritis	37.60	26.49
enereal diseases	34 33	57.57
ronchitis	28.52	24.50
engue	16.71	5.58
ysentery	9.99	8.96
nkylostomiasis	9.45	16.53
uberculosis (all)	4.54	6.57

CONSTANTLY NONEFFECTIVE RATES.

The constantly noneffective rate for 1915 was 15.68 per 1,000, as ompared with 20.30 in 1914. The rate for disease was 13.31 per ,000 in 1915, and 17.48 in 1914, while that for external causes was .37 per 1,000 in 1915 and 2.82 in 1914.

The following tabulation shows the noneffective rates for the rincipal diseases in 1915 as compared with 1914:

	1915	1914
enereal diseases	1.96	3.66
alarial fevers	1.54	3.48
cute abscess and cellulitis	1.05	.79
iberculosis (all)	.58	.82
ysentery	.56	.39
uruncle and carbuncle	.48	.62
ronchitis	.48	.60
iarrhea and enteritis	.45	.30
nkylostomiasis	.19	.46
umps	.17	.41
heumatism, articular	.03	.23

From the comparisons afforded by these tabulations, it is noted that venereal diseases, which last year (1914) showed such an alarming increase, during 1915 shows a marked improvement, although still leading the list with the highest noneffective rate. This rate has been heretofore, with the exception of 1914, but a fraction of that for American troops in the Philippines, and the disastrous results attending the development of a high rate for venereal diseases would be obvious. The most marked improvement is to be noted in the admission rate for malarial fevers, being a reduction from 201.80 in 1914 to 80.11 in 1915. While the rate for dengue is tripled for 1915 over that for 1914, yet the noneffectiveness from this disease is so small as to preclude its entry in the tabulation for the principal diseases. Diarrhea and enteritis show an increased admission and noneffective rate over that for 1914.

TABLE NO. 37.—*Movement of sick, Philippine Scouts, enlisted men, year 1915.*

For each case	9.97	10.07	9.24	....

DISCHARGE FOR DISABILITY.

During the year 1915 there were 63 discharges from all causes, a increase over 1914 of 15. Of this number 58 were for disease and for injury, making a discharge rate of 11.44 per 1,000. Tuberculosi the same as last year, is the cause of the greatest number of di charges, there being 25 discharges during 1915. Mental alienatic caused 16, and leprosy and neuritis 2 each. In 1914 tuberculos caused 26 discharges, mental alienation 10, and leprosy 4.

DEATHS.

There were 14 deaths from all causes during 1915, with a rate of 2.54 per 1,000, and 16 with a rate of 3.19 in 1914. Tuberculosis, which causes the greatest number of deaths, for 1915 does not appear among the diseases given, while in 1914 this disease was the cause of 4 deaths. There were 2 deaths from homicide and 1 from suicide.

SPECIAL DISEASES.

TYPHOID FEVER.

There were no cases of this disease among the Philippine Scouts.

MALARIAL FEVERS.

The admission rate for all fevers of this class was 80.11 per 1,000, as compared with 201.80 in 1914 and 193.49 in 1913. This rate is the lowest in the history of the Philippine Islands, an evidence of the persistent and vigorous antimosquito campaign that is being waged. Certain posts in the Philippines, however—notably Camp Stotsenburg, Pampanga—continue to show high admission rates for malaria. This post is not properly screened, in spite of repeated recommendations. The same statement is true of other Army posts. The relation of mosquitoes and other insects to disease incidence is now so well known that to defer the matter of complete screening of all quarters in the Army is inexcusable. "Lack of funds" or "insufficient appropriations" for this important work should no longer be accepted and the responsibility for this serious defect definitely placed.

TYPHUS FEVER.

There were 3 cases of this disease among native troops at Camp Keithley, Mindanao, where last year an epidemic resulted in 24 cases, 18 among the scouts and 6 civilians. A special report on the epidemic occurring in 1914 was made to the Surgeon General, and the article was considered of sufficient importance to publish it in the Archives of Internal Medicine, September, 1915.

VENEREAL DISEASES.

These diseases furnish an admission rate of 34.33 per 1,000, a compared with 57.57 in 1914, a marked reduction. Of a total of 18 admissions, 31 were for syphilis, 17 for chancroid, and 141 for gonor rhea, as compared with 45, 34, and 210, respectively, for 1914. Th noneffective rate for all venereal diseases was 1.96, as compared wit 3.66 per 1,000 in 1914.

SMALLPOX.

No case occurred during the year.

CHOLERA.

Two cases of this disease occurred during the year, with one deat An epidemic occurred at Tamparan and the immediate vicinity Camp Keithley, Mindanao, resulting in 20 deaths among the civili population. This epidemic seemed to be continuous with the one th had been traveling through the island of Mindanao during the ye 1915. The disease appeared at Tamparan during the last week November in a company of Constabulary soldiers recently broug there from Gannassi.

TUBERCULOSIS.

There were 25 cases of this disease, with an admission rate of 4.54 per 1,000, as compared with 33 cases and an admission rate of 6.57 in 1914. There were no deaths, all being discharged.

DYSENTERIES.

Fifty-five admissions for this disease during the year, of which number 21 were classed as bacillary, 28 as entamoebic, and 6 unclassified. The rate for this disease was 9.99, as compared with 8.96 for 1914. The noneffective rate was 0.56 per 1,000. One death resulted in the unclassified.

DENGUE.

Dengue, or "breakbone fever," is an acute disease of tropical and subtropical countries, characterized by severe pains in the muscles and joints and by an eruption similar to measles. The mortality is practically nil. It has been demonstrated that it is transmitted by the culex fatigans species of mosquito.

Ninety-two cases of this disease occurred among the native troops, with an admission rate of 16.71 per 1,000 and a noneffective rate of 0.28. There were no deaths.

DIARRHEA AND ENTERITIS.

Two hundred and seven cases occurred, making an admission rate of 37.60 per 1,000, as compared with a rate of 26.49 in 1914. The noneffective rate was 0.45.

ALCOHOLISM AND ITS RESULTS.

But one admission is recorded for this disability, the admission rate being 0.18 per 1,000.

BERI BERI.

No case of this disease occurred among the scouts during the year.

UNDETERMINED FEVERS.

There were 32 cases of undetermined fevers during the year. Under this heading are included febricula, simple, continued, and other fevers of undetermined causation. The admission rate was 5.81 per 1,000, as compared with 3.78 in 1914.

The following table exhibits the various surgical operations performed on the Philippine Scouts during the year:

INFLUENCE OF SEASON.

Excluding injuries, venereal diseases, alcoholism, and vaccinia, as ninfluenced by the seasons, the highest admission rate was in June nd the lowest in October.

The highest noneffective rate for the same was in June and the west in November. The highest rate for malarial fevers was in May.

TABLE No. 41.—*Influence of season on Philippine Scouts, year 1915.*

PREVALENCE OF DISEASES, BY RACES.

With the exceptions of diarrhea and enteritis, furunculosis, mal ria, conjunctivitis, trichophytosis, dysentery, and intestinal par sites, the rates for the Philippine scouts were all lower than f either the white or colored American troops. It should be borne mind that the native troops are serving in their own country unc conditions natural to them, to which American troops are not acc tomed.

The rates for the American white and colored troops and Scou are compared in the following tabulation:

	White.	Colored.	Scot
Admission rate	954.35	1,272.93	5'
Noneffective rate	28.20	36.57	
Death rate	2.46	5.97	
Discharge rate	23.79	18.64

SANITATION IN THE PHILIPPINE ISLANDS.

The department surgeon, Philippine Department, reports as follows:

AUGUR BARRACKS, JOLO.

This station shows a marked decrease in admissions on account of malaria and a slight decrease in the number of venereal cases.

The surgeon reports:

"Malaria, reported by my predecessors and continued by myself until I could verify or disprove it, as the chief disease here, does not in the light of over 300 blood examinations appear to prevail so extensively as stated * * * November 1, two companies, on surgeon's recommendation, stopped taking quinine. Their bloods (204 cases) were all examined between November 20 and December 12, without finding the plasmodium. The number of admissions, all cases from these two companies, were 13 in November as against 14 for the preceding month. In addition, all admissions to the medical ward had from two to four blood examinations, and only five times was the plasmodium found in the entire command."

He adds that the studies along this line will be continued, and a report will be made should the results show any cause for a change of opinion.

The usual antimosquito measures are carried out at the post.

He remarks with reference to the venereal problem:

"The venereal diseases constitute a large factor in the morbidity. There is evidently much clandestine prostitution, and the native soldier does not yet understand the seriousness of the venereal disease and the value of prompt prophylaxis after exposure. Prophylaxis stations and short, frequent lectures regarding the same and the necessity of early prophylaxis after exposure are employed to combat venereal disease."

During May and June cholera was epidemic in the adjacent barrios and throughout the island, but only two cases, with one death, occurred among troops.

Bacillary dysentery appears from time to time. This is attributed by the surgeon to contact infection from the civil population, in which the disease appears to be ever present.

CAMP ELDRIDGE, LAGUNA.

This post shows a decided improvement in the morbidity on account of malaria and a marked increase in the venereal diseases.

The usual antimalarial measures have been carried out.

The surgeon reports as follows with reference to antivenereal procedures:

"The special steps that have been taken to control venereal diseases are: Treatin in hospital all syphilitic cases in the infectious stage and isolation in post of all othe venereal cases; providing venereal prophylactic; disciplinary measures institute in all cases of venereal disease where failure to take venereal prophylaxis is shown lectures by medical officers given to the command on personal sanitation; the sourc of all cases of venereal disease sought out and the woman's name submitted to th authorities of Los Banos for isolation and treatment; semimonthly inspection of th command by medical officers."

CAMP JOHN HAY, BENGUET.

The surgeon reports skin diseases due to the wearing of "G" strings and foot injuri due to going barefooted. The uniform of Igorot scouts has now been changed to co form to that of other scout soldiers, and they now wear breeches, leggings, and shoes a part of the uniform.

CAMP KEITHLEY, MINDANAO.

An epidemic of measles appeared at the post in October following the arival of t Forty-seventh Company of Philippine Scouts from Fort Mills, where the disease h been more or less prevalent.

There is very little venereal disease at the post. The surgeon reports that existing orders relating to the prevention of this class of diseases are strictly complied with.

There has been a decided decrease in the malarial rate over that of the previous year. The surgeon reports the following measures for the control of the disease.

1. The constant use of mosquito bars in barracks and hospital, the bars being lowered at 4 p. m. daily.

2. Routine blood examinations of all cases of whatever nature admitted to hospital.

3. All positive cases kept in hospital and under treatment for at least one week, subsequent daily observation with treatment for two weeks, and weekly observation for a period of three months thereafter.

The surgeon again calls attention to the unfortunate condition at the post resulting from the large civilian population thereat, members of families of native soldiers, for whom no adequate accommodations are provided. This matter was referred to in the last annual report from this office, and the comment appears on page 113 of the annual report of the Surgeon General for 1915.

CAMP M'GRATH, BATANGAS.

The prevailing diseases have been dengue and venereal troubles.

The records show a considerable reduction in both venereal diseases and malaria over the rates for the preceding year.

The post authorities have cooperated with those of the neighboring municipality of Batangas in the matter of the general sanitation of the latter, and also with reference to the venereal problem.

The surgeon reports as follows with reference to measures against the venereal diseases:

"The name and address of the woman, or the license number of the house and inmate, with the time of intercourse, are recorded on prophylaxis cards. When a man contracts a venereal disease the woman is examined by an Army medical officer, and if positive, she is quarantined by the municipal health department until the health officer is notified by an Army medical officer that she is cured, the necessary examinations being made at the post hospital. The Japanese prostitutes are examined and certified to by the surgeon. There has been a marked improvement under this plan. In addition to the prophylaxis station at the hospital, a separate one is maintained at the corral, which is located practically on the outskirts of the town, thus affording the opportunity for prompt treatment. Men who contract these diseases are kept on sick report until danger of dissemination thereof has passed. Those failing to take the prophylactic are court-martialed."

CAMP STOTSENBURG, PAMPANGA.

Notwithstanding the efforts of the post authorities the admissions to sick report on account of both malaria and the venereal diseases have been greater than for the preceding year.

The surgeon reports as follows:

"The most marked sanitary defect has been the absence of screens in barracks and quarters. Also the scout post is located in an infected area, and troops quartered there have shown a high malarial incidence.

"A very active antimosquito war has been constantly waged, and the grass, brush, and undergrowth have been cut for a wide area about the post. * * * All ditches are kept open, all holes are filled, ditches and moist places are petrolized, and breeding places are constantly sought."

With reference to the venereal problem he remarks:

"Most of the cases come from Angeles, a town 6 miles distant, and in which there is no adequate regulation of prostitution. A model or sanitary barrio is situated about a mile from the post and which is countenanced. Records kept of venereal admissions show relatively few venereal cases originating in this barrio. The prostitutes who are unable, on account of venereal disease, to secure admission to this barrio become inmates of houses of prostitution in Angeles, and those who become diseased in this barrio, and are not permitted to operate there, immediately go to Angeles and continue their operations unmolested."

FORT MILLS, CORREGIDOR, AND SUBSTATIONS.

At this group of stations there have occurred at various times during the year among the population cases of mumps, measles, dengue, whooping cough, smallpox, cholera, and all the venereal diseases. The one case of cholera occurred in a native employee at Fort Hughes (Caballo Island). One case of smallpox developed in a native civilian employee at Fort Drum (El Fraile Island) and one of varioloid in a Coast Artillery soldier at Fort Mills.

There has been an increase in both venereal diseases and malaria over the rate for the preceding year, the latter increase being a very decided one.

The surgeon reports:

"All regulations complied with in regard to veneral diseases and malaria fever."

He also reports that during the year sewage and drainage systems have been greatly improved, and that sanitary conditions at this post (Fort Mills proper) are good.

FORT SAN PEDRO, ILOILO.

This post shows a very decided reduction in the admission rate for both malaria and venereal diseases over the figures for those diseases for the preceding year. The venereal rate is still high for a station garrisoned by native troops, but is far below that for any of the American garrisons, being 77 per thousand as against 214.7 for the year 1914.

The methods reported by the surgeon in handling both the malarial and venereal problems are well planned and appear to have been carefully carried out, and with good results.

FORT WILLIAM M'KINLEY, RIZAL.

The prevailing diseases during the year have been venereal, dengue, digestive disorders, and cutaneous troubles. The venereal rate has been somewhat reduced, but is still high. Prophylactic measures are conscientiously carried out at the post, and the various prophylactic stations in Manila cooperate with the authorities of this and other stations in the vicinity, but the proximity of a large oriental city makes the problem a difficult one. The malarial rate is low and shows a considerable reduction over that of last year. The surgeon reports that most of the cases coming under treatment have been contracted in other localities.

Two cases of diphtheria, with one death, have occurred in enlisted men during the year, and several cases have occurred among the civilian population of the post.

The sewage disposal system has given trouble, and a new plant is under consideration, and plans therefor have been prepared. The surgeon reports that the trouble, due to lack of capacity of the tank, has been remedied by allowing the sewage to pass directly into the Pasig River. Inasmuch as either bank is dotted with habitations, singly and in barrios, and since the river passes through the city of Manila a few miles farther down, this is a most undesirable expedient.

LUDLOW BARRACKS, MINDANAO.

Malaria has been the prevailing disease at this post during the year. There was also an epidemic of mumps. There has also been a considerable amount of cholera and smallpox in the immediate vicinity of the post, but no cases of either at the station.

This post shows the highest admission rate for malaria of any station in the department, but the rate per thousand has been cut down from 791.3 in 1914 to 220.4 for 1915. The surgeon reports the following as the measures for the control of the disease:

1. Prompt isolation and treatment in hospital of all cases.
2. Weekly administration of 1 gram quinine in solution to every man of the command.
3. Daily administration of quinine to all cases of malaria for six weeks after return to duty.
4. All barracks and quarters screened, and the general use of the mosquito bar is enforced.
5. Grass cutting and drainage of standing water in constant progress.
6. Standing water incapable of drainage oiled weekly by details from the hospital.

Only 13 new venereal cases were taken up during the year. The surgeon reports that there has been no case of chancroids and no new cases of syphilis during the time. Prophylaxis, semimonthly inspections, and hospital treatment are the preventive measures in force.

The surgeon reports the following as the sanitary defects at the post:

1. Water in mains drawn from Nituan River, and highly infected, is used for bathing and washing.
2. Swampy section in northeast corner of post.
3. Six pail closets, remaining from old system of disposal of excreta, still in use.

4. The great extent of the post, necessitating a large amount of work in keeping cogon grass and other undesirable vegetation under control.

With reference to the correction of these defects, the surgeon states as follows:

"1. An artesian well-drilling outfit is at work on the post, and it is expected that a supply of artesian well water will eventually be available for use in the mains.

"2. A reduction of the area of the swamp referred to by drainage by post labor has been effected, and the work is being continued to the extent of keeping open the ditches. He believes that further improvement is possible only by extensive filling at a cost which would probably be prohibitive, and certainly so under present conditions.

"3. Plans have been prepared and estimates made and forwarded for the replacement of all sanitary pails by water-closets."

CITY OF MANILA.

The following stations are located within the city limits: Cuartel de Espana, Cuartel de Infanteria, department hospital, Fort Santiago, medical supply depot, Manila ordnance depot, and quartermaster's depot.

Of these stations, Cuartel de Espana has normally a garrison consisting of regimental headquarters and a battalion of Infantry.

Fort Santiago (department headquarters) has one company of Infantry as a headquarters guard, one company of signal corps is quartered at Cuartel de Infanteria, a detachment of ordnance at the Manila Ordnance Depot, and detachments of the Hospital Corps at the department hospital and medical supply depot.

In general terms, and with the restriction that they are under military control, it may be said that the sanitary conditions of these stations are those of the city, and the sewer systems, general water supply, and environment are those of the city. The department hospital is practically the post hospital for all, as only dispensaries are maintained at the individual stations.

Stations for venereal prophylaxis have been established at the department hospital, and the dispensaries at Cuartel de Espana and Fort Santiago where treatment can be obtained at all hours, not only by the enlisted men stationed in the city, but also by those on pass in Manila from Fort McKinley, Fort Mills, and other posts in the vicinity. The existence of these stations is officially made known to the members of the commands of such posts, and form part of the prophylactic system thereof, cards from the stations referred to being forwarded to the surgeon of the command to which the man belongs.

At Cuartel de Espana, the only station of the group having a garrison of any considerable size, the venereal rate is somewhat higher than for the previous year (226.2 per 1,000 as against 203.4). From March to October, 1915, the garrison consisted of colored troops. The usual methods have been followed with reference to venereal diseases, and all orders and instructions relating thereto have been carried out. The rate of admissions on account of malaria has been greatly reduced. Mosquito destruction, use of mosquito bars, and the segregation and following up of cases being the methods employed for its control.

In common with other stations of the Manila group, dengue has been the prevailing disease, the principal epidemic occurring during the months of July and August, with occasional cases throughout the year.

An artesian well between seven and eight hundred feet in depth has recently been bored at Cuartel de Espana, and a covered steel tank of 10,000 gallons capacity with the necessary pumping machinery has been installed. The purpose of this well is to supply not only Cuartel de Espana but the entire military population of Manila with potable water to replace distilled water should the plan prove satisfactory. The water from this well has a slightly saline, or more properly "mineral," taste so common in waters from wells of this character. When taken directly from the well it gives a bacterial count of about 60 colonies per cubic centimeter, with no gas producers. The water in the tank later showed a bacterial count of 20,000, and from the outlet pipe 60,000 per cubic centimeter, with no gas producers. The matter of disinection of the tank was turned over to Maj. Carl R. Darnall, Medical Corps, and on November 30 he put into it a solution of hypochlorite of lime containing sufficient available chlorine to give a concentration of about 16 parts per million in the 10,000 gallons of water in the tank. This strongly chlorinated water was allowed to remain for 8 hours. The water was then drained out and the tank refilled on December 2, 1915, nd the water allowed to stand. The first sample from this filling was taken December and gave a count of 5,500 per cubic centimeter. The second sample of the same water aken December 4 gave a count of 50,000 per cubic centimeter. The third sample taken n December 6 gave a count of 30,000. The fourth and last sample from this filling was taken December 7, five days after the tank was filled, and gave a count of 550,000 per cubic centimeter. No gas producers in any of the samples. The tank was then emptied and refilled, and a sample taken 24 hours later gave a count of 25,000 per cubic centimeter. This was likewise free from gas producers.

To observe the action of the water under service conditions the water was drawn off during the forenoon of December 8 and refilled during the afternoon, and the process repeated for the six succeeding days, samples being taken while the tank was being emptied. These samples gave respective counts as follows: December 10, 55,000; December 11, 40,000; December 13, 20,000; December 14, 23,000. No gas formers were present in any sample.

The bacteriological work was done at the department laboratory by Capt. W. H. Allen, Medical Corps.

In submitting his report, Maj. Darnall comments as follows:

"From this series of tests it appears probable that the few harmless bacteria in the water as it comes from the well rapidly multiply in the tank, which, when warmed by the sun, acts as a very efficient incubator. Hence a high bacterial count in the water taken at the outlet 24 or more hours after filling the tank is of no significance in itself. It shows, however, that the water contains substances on which the bacteria (of the kind found) grow readily, and the possibility of pathogenic germs doing the same, should they by chance gain access to the tank, must be considered."

He further comments on the possibility of contamination during the process of delivery.

On December 21, 1915, after consultation with Maj. Darnall, the department surgeon transmitted to the department commander the report referred to, with the following comment:

"2. The inference to be drawn from the results of the very thorough study which Maj. Darnall has made of the subject is that the water of the well is potable, but that it is of a character which favors the rapid growth of bacteria, and that it will require exceptional care in handling. The bacteria which have already been found are in themselves harmless, but their rapid multiplication affords an index of what would happen in the event of the infection of any part of the system of supply by the accidental introduction of the organisms of cholera, typhoid fever, or other water-borne diseases.

"3. If proper precautions are taken and unceasing vigilance is exercised, it is believed that this well can be safely used as a source of supply, but in the event of its being so used, the danger of careless handling should be thoroughly understood by all who are responsible for its distribution.

"4. I recommend that the well be put in use, and that pumping be regulated by the daily requirements in order that surplus water be not allowed to accumulate; that water wagons and utensils used in distributing be frequently sterilized by steam; and that all possible precautions be taken in handling the water. I further recommend that samples of water from the tank, service pipe, and water wagons be collected weekly and sent to the department laboratory for examination."

Water from the well has recently been supplied with more or less regularity, and the matter is still under investigation, additional samples being taken for examination from water coolers and other places of terminal distribution. Certain complaints from consumers have been personally made to the writer, but these ordinarily refer to the taste of the water, which is appreciable to persons accustomed to the use o distilled water. In this respect it is considered that the Cuartel de Espana water is equal to or superior to that furnished by the artesian wells at Fort McKinley.

A new distilling plant is being installed by the Quartermaster Department at its depot to replace the one now in use. This will be held in reserve for use should the well water become infected or be finally considered unfit for use.

A second artesian well is now being bored at the department hospital.

PETTIT BARRACKS, MINDANAO.

The surgeon reports that there have been no prevailing diseases during the year A slight outbreak of dengue occurred in June. Venereal diseases have been rare There has been a marked decrease in the malarial rate. Troops sleep under mosquit bars in screened buildings, and draining and the usual antimosquito measures hav been carried out.

There is no sewerage system, and dry-earth closets are in use at the post.

REGAN BARRACKS, ALBAY.

The venereal rate at this station has practically doubled during the past year, and, with the exception of that among troops of the China expedition, is the highest in the department. The matter was taken up from this office, and the post authorities attempted and partially succeeded in enlisting the assistance of the local civil authorities in an attempted solution of the problem. In November the surgeon sent to the department laboratory a considerable number of blood specimens for Wasserman test, and explained to this office that these were from prostitutes who had been arrested by the civil authorities. He reported as follows in connection therewith.

"All known prostitutes are being arrested and examined by the district health officer and the medical officers of the command. All found infected are tried and sentenced to jail. During their confinement they are treated until noninfective. These 24 specimens are from women now undergoing confinement, as it is desired to know the number suffering from syphilis in addition to having gonorrhea and chancroids. The civil authorities have set aside a designated area, and when these prostitutes are rendered noninfective will require them to live in that area and be subjected to weekly inspections. All prostitutes found outside of the area will be arrested and confined.

The surgeon further reports that all orders with reference to inspections and prophylaxis are carried out, and that all infected men are quarantined and treated until they cease to be infective.

In this, as at all other stations, clandestine prostitution is undoubtedly an important factor in the spread of this class of diseases.

The admission rate for malaria has been considerably reduced during the year.

WARWICK BARRACKS, CEBU.

The surgeon reports that dengue is endemic in Cebu, and that with the exception of minor acute gastrointestinal disturbances and respiratory disorders this disease has furnished the greater part of the admissions to sick report during the year.

He also states that there is practically no malaria in Cubu, and states that the cases are usually imported ones, about 30 of these having recently been brought to the post with the battalion of native troops transferred from Camp Overton. The usual antimalarial precautions are taken.

The venereal rate is small. Existing orders with reference to this class of diseases are carried out.

The cuartel and hospital are reported as being located "in the dirtiest part of the city," and officers are quartered in rented buildings in the town. "The quarters of married enlisted men living out of barracks are usually dirty and badly overcrowded. The poor housing is undoubtedly a prominent factor in the causation of the respiratory disorders with which these people are affected."

TIENTSIN, CHINA, AND SUBPOSTS OF CHINA EXPEDITION.

This command continues to lead the department in the admission rate on account of venereal diseases, and the figures are slightly larger than those of the preceding year. The surgeon reports that all War Department instructions with reference to these diseases have been carried out, supplemented by restriction to barracks of all cases undergoing treatment outside of hospital until they have ceased to be infective. He further states that the rates have been high, owing to local conditions. "On account of the delicate international relations existing here it is not believed that it will be practicable to institute any control over prostitution and prostitutes in the various concessions." This question has been taken up by this office at various times and it is believed that the military authorities are taking every possible step to control the evil.

The malarial rate is not large and shows little change from that of the preceding year. Owing to local conditions no extensive antimosquito work is practicable.

There have been no prevailing diseases except venereal.

The general sanitary condition is reported as "excellent, when due allowance is made for the lack of modern heating, plumbing, and lavatory conveniences."

CONCLUSION.

In closing, the department surgeon desires to say that general sanitary conditions hroughout the department are satisfactory. There has been a decrease in the numer of deaths, and had it not been for the extensive prevalence of dengue and the slight increase in the venereal rate the same remark would have applied to the morbidity.

It is interesting to note that over half the deaths in the department among white troops during the year occurred as a result of traumatism or drowning, and it is a still more interesting fact that practically 25 per cent of the total death rate in the same class of soldiers is made up by cases of suicide.

The question of Medical Department personnel for this department was fully discussed in the department surgeon's report to the department commander, and was by him embodied in his annual report which has already reached the Surgeon General's Office. When the personnel now under orders for duty with this command shall have reported, it is believed that all ordinary conditions can be successfully met.

The commissioned personnel has been generally efficient, and the department surgeon has been particularly pleased with the manner in which a number of the junior, and consequently untried, officers of the Medical Corps have acquitted themselves when it became necessary, owing to a deficient personnel, to place them in positions of responsibility which would not ordinarily have been given to officers of their rank and experience. The manner in which they have taken hold of and carried on their work has furnished another evidence of the value of the training given at the Army Medical School.

The work of the Hospital Corps has been generally satisfactory. As in all bodies of men of considerable size, there are many who could have been replaced with great advantage. It is desired to mention particularly the good work of many of the older noncommissioned officers, as well as other old and faithful soldiers who have not been so fortunate as to win their chevrons.

It is regretted exceedingly that the law does not permit compensation commensurate with the value of their services.

HAWAII.

The mean enlisted strength of the troops serving in Hawaii during the year 1915 was 8,572, as compared with 7,971 during 1914. Of these, 1,863 were colored. A remarkable feature in connection with the rates for Hawaii in comparison with those for the United States is that while the total admission rate, noneffective, discharge, and death rates are lower, yet the individual rates for the preventable diseases are somewhat higher, especially that for venereal diseases. The average number of days' treatment for each case was 13.11, as compared with 13.34 for the United States.

ADMISSION RATES.

The admission rate during 1915 was 568.94 for total enlisted men per 1,000, as compared with 523.27 for 1914. The rate for disease alone was 440.85 per 1,000 and that for external causes 128.09; that for disease in 1914 was 401.96 and for external causes 121.31.

CONSTANTLY NONEFFECTIVE RATES.

The constantly noneffective rate was 20.44 per 1,000 for all causes in 1915, as compared with 18.75 for 1914. The rate for disease was 16.39 and that for external causes 4.04 per 1,000, as compared with 14.33 for disease and 4.42 for external causes in 1914.

DISCHARGES ON CERTIFICATES OF DISABILITY.

The rate for discharges for disability was, for all causes, 10.92 per 1,000, 9.79 being for disease and 1.13 for external causes. In 1914 the total rate was 9.02, that for disease being 7.89 and for external causes 1.13 per 1,000.

DEATHS.

The death rate (total) was 3.04 per 1,000, that for disease being 2.25 and for external causes 0.79, as compared with a total rate of 1.63, 1.13 for disease and 0.50 for external causes per 1,000 in 1914. In actual numbers 27 deaths occurred among the enlisted personnel, 20 being due to disease and 7 to external causes. Two of these deaths from external causes were due to suicide; 1 from suffocation, strangulation; 1 from drowning, accidental; 1 from traumatism by crushing; 1 from homicide; and 1 from other external violence.

INVALIDING TO THE UNITED STATES.

In 1915 there were 142 cases invalided home; in 1914 there were 141, and in 1913 there were 106.

The diseases or conditions causing the highest number of cases to be invalided home were:

Mental alienation, 33; tuberculosis, 28; syphillis, 9; organic disease of the heart, 8; chronic alcoholism and epilepsy, 5 each; and 5 cases of enuresis.

Enlisted men invalided home from Hawaii, year 1915.

Cause.	Number of cases.	Per centage of total cases.	Duty.	Discharge on certificate of disability.	Died.	Otherwise disposed of.	Remaining at end of year.

SPECIAL DISEASES.

TYPHOID FEVER.

An epidemic of typhoid fever occurred at Schofield Barracks dur- ng the latter part of the year 1915, the last case of which occurred n February, 1916, to determine the incidence of which the surgeon ıt that post appointed a board of medical officers to investigate it arefully. The work was carried out under three heads, viz. first, a areful tabulation of the cases according to the form desired by this ffice; second, a survey of the food and water supplies; and, third, n attempt to establish the presence of a carrier.

The board, composed of Maj. H. D. Bloombergh and Lieuts. G. R. 'allender, R. W. Bliss, and R. H. Duenner, ably assisted by Capt. '. H. Foucar, of the Department Laboratory, Hawaiian Department, ıvestigated the following cases, which occurred on the dates specified:

o.	Date.	Name.	Sex.	Age.	Nationality, etc.	Place.
	1915.					
1	Oct. 15	A. H.[1]	Female	8	Japanese	Lieut Sears's quarters, First Infantry.
2	...do	J. F	Male	8	American	Son of Capt. Fair, Quartermaster Corps.
3	Oct. 25	F.[1]	...do	23	Soldier	Company F, First Infantry.
4	Oct. 27	O.[2]	...do	29	Japanese	Capt. Knight's quarters, First Infantry.
5	Oct. 28	I. Y.[1]	Female	26	.....do	Maj. Sorley's quarters, First Infantry.
6	...do	S	Male	24	Soldier	Company I, First Infantry.
7	Nov. 2	D	...do	19	.....do	Company E, First Infantry.
	Nov. 15	L	...do	24	.....do	Troop K, Fourth Cavalry, near First Infantry.
	Nov. 18	B	...do	23	White civilian	Civilian employee, Quartermaster Corps, near First Infantry.
	Dec. 24	U.[1]	Female	25	Japanese	Quartermaster camp, 7 miles from camp.
	1916.					
	Jan. 14	Y. F.[1]	Male	25	.....do	Lieut. Kieffer's quarters, Fourth Cavalry.
	Jan. 29	C	...do	30	Soldier	Company I, First Infantry.
	Feb. 20	T. S.[1]	Female	25	Japanese	First Infantry tailor shop.

[1] Transferred to other hospitals.

[2] Died in department hospitals.

At Schofield Barracks during the two years prior to October, 1915, ere have been no cases of typhoid fever and but one case of para- phoid fever in July, 1915.

Schofield Barracks in its entirety extends, roughly speaking, over square miles of territory. Locally it is known to consist of two ırts, the upper, old, or cantonment section is called Schofield Bar- cks, while the lower, new, or concrete portion is called Castner, ter the railroad station of that name. All of the cases of typhoid, th one exception, occurred in the Castner section, the excepted se (U.) arising at the quartermaster construction camp connected th the building of the new water-supply system, and distant from e post about 7 miles. The entire command was on maneuvers ar Fort Shafter from October 13 to October 23, when the enlisted en visited Honolulu, where typhoid fever is endemic. Notwithstanding this fact, it is believed from a study of the clinical records in cases 3, 6, and 7 that these soldiers most likely were infected in the post and not at Honolulu.

The water supply of Schofield Barracks proper is obtained from tunnels driven into the Waianae Range of mountains. The tunnels bring the water into reservoirs located about 1½ miles from the post, from whence it is pumped into tanks, which then supply the post by gravity. No cases of typhoid fever have occurred in the Schofield section.

The water supply of the Castner section at present comes from the South Fork of the Kaukonahua River, the water being conducted to the post by means of an extensive system of partly concreted tunnels, which pick up the stream high up in the Koolau Range and carry it through hillsides or in the open for a distance of 3 miles to a reservoir, whence a pipe line takes it to the post, a farther distance of 6 miles. While these typhoid cases were occurring this system of water supply had not been put into effect. The water supplied to the Castner and only occasionally to the Twenty-fifth Infantry section of Schofield came from the reservoir. This reservoir is formed by a dirt embankment across a gulch and is fed by surface water and small springs. The flow from this reservoir was augmented at times by water pumped directly from the South Fork by a pumping station 3½ miles from the post.

For the construction of the tunnel system a camp for employees was established in the vicinity of the line of construction. On an inspection trip made January 22, 1916, inquiry was made of various white and Japanese employees with the idea of determining the possibilities of a water infection of the Castner section. Water was pumped from time to time between September 14 and December 26 1915, from the open South Fork River into the main supply line t the post and twice in January, 1916, for three hours at a time. Th course of the river is through uninhabited regions, and the water i as safe as such waters can be.

It seems further that about December 22, 1915, a Japanese labore left the camp sick of some unknown condition and, a few days later a sick Japanese woman went to Honolulu from the camp. Abou this time the department of health in Honolulu gave the informatio that a Japanese woman formerly employed in Schofield Barracks wa sick at the Japanese hospital with typhoid fever. This seems to refe to one and the same woman and the name of the sick woman wa given as U. Unfortunately there is an irreconcilable conflict o dates as to the occurrence of this illness. During the construction c tunnels, the camp for Japanese workmen referred to was maintaine about 2 miles above the reservoir. The sanitary arrangements c the camp were very good. It was learned, however, that while thes workmen were supposed to use buckets for their excreta while workin in the tunnels, in spite of this fact the tunnels became soiled; furthe more, that about December 26, 1915, the tunnels were cleaned out an that this filth was swept into the reservoir.

It is an easy assumption to make (but one untenable on account the lack of exact information) that U. acquired her typhoid feve at the quartermaster camp along the tunnels, that she went out the camp by way of the tunnels, that she scattered the organisn along the route, and that this one case gave rise to cases 11, 12, and 1

But assuming for the sake of argument that this woman might have been so responsible, such fact would throw no light on the earlier cases unless she had acquired her disease from some earlier carrier in the camp.

On February 13, 1916, the following report of water examination was made by Capt. Foucar, in charge of the department laboratory:

> Fourth Cavalry supply (Schofield Barracks): No gas formation in three lactose fermentation tubes; colony count per cubic centimeter 0.25 (1 colony in 4 cubic centimeters).
>
> First Infantry supply (Castner): Gas production, No. 1 tube, 30 per cent; No. 2 tube, 30 per cent; No. 3 tube, 40 per cent; still active gas production at end of 24 hours in all three tubes; colony count per cubic centimeter 0.40.

Vegetables and fruits are supplied to the post very generally by Japanese, Chinese, and Korean hucksters. There are about 18 of these men who have their own wagons and peddle their supplies daily, with the exception of one or two. These men get all of their vegetables and fruits from gardens at Waialua, 8 miles from the post. These gardens are kept by six Chinese families, and are irrigated by running water from the Koolau range in a series of ditches. The gardeners live in wooden shacks by the side of the gardens and have dry earth closets in the rear of these gardens. They use no human excreta for fertilizing purposes and the gardens are especially well kept. The gardeners are in all instances Chinese who deny sickness. Two of the hucksters have their own gardens at Wahiawa. They also have dry earth closets and do not use human excreta for fertilizer, and show no evidence of ill health. There are two vegetable markets n the post, one run by an Hawaiian woman, who gets her vegetables from the gardens, and a Chinese who gets his vegetables from Wahiawa and Waialua. At times these markets and the post exchange and the different organizations purchase vegetables and other supplies from the markets in Honolulu.

Milk and cream are supplied to the post from two sources. All of the officers are supplied from the T. ranch, which is situated miles from Wahiawa and 6 miles from the post. The dairy is conducted in a fairly clean manner. Mr. T. has a herd of about 0 tuberculin-tested cows. These animals are fed, for the most part, on imported alfalfa, the grazing facilities of this country being very poor. The cows are milked twice daily in sheds with cement loors by four Japanese. There is running water in the milk shed nd the milkers are clean and fairly careful. The milk is milked into mall-mouthed tin pails and is taken to another building where it is ooled. The cooling system is crude, but answers the needs fairly well. The milk is then collected in glass bottles, which are kept lean by soap and water, and immediately delivered by means of a motor truck to the post. The cows are milked at 4 a. m. and 1.30 . m., and two deliveries made daily. All of the employees of this airy have been examined (by Widals), with negative results. The ifferent exchanges and restaurants connected with them get their milk from the Honolulu Dairymen's Association, delivered to the ost by motor truck.

For the sake of completeness the following table shows the result f examinations, made by the department laboratory, of the milk from the post dairy during 1915.

Date.	Butter fat.	Specific gravity.	Bacteriology count.
1915.	*Per cent.*		
June 3	3.2	1.029	10,000
June 7	3.0	1.029	1,200
June 17	3.2	1.030	16,000
July 7	3.4	1.030	1,250,000
July 22	3.6	1.030	9,000,000
Aug. 7	2.7	1.030	2,000,000
Aug. 19	3.2	1.030	20,000
Oct. 15	4.4	1.031	4,000,000

A bacteriological count made February 11, 1916, showed 246,000 bacteria per cubic centimeter.

The milk gave no reaction to tests for formaldehyde, salicylic, benzoic, and boric acids.

The following table gives the most essential features of the cases among the enlisted men:

No.	Name.	Immunization completed.
3	F.[1]	Jan. 22, 1914
6	S.	Feb. 10, 1914
7	D.	Feb. 23, 1915
8	L.	Apr. 1, 1913
12	C.	Mar. 16, 1915[2]

[1] Transferred to department hospital; no record.

[2] 2 doses only.

These cases were clinically typhoid fever. Case No. 8 was mild. Cases Nos. 6 and 12 were moderately severe. Case No. 7 was extremely severe and characterized by delirium. All recovered. None had hemorrhage. Case No. 6 had two relapses, and case No. 12 had phlebitis, left leg, and cystitis.

In the attempt to isolate a carrier, it was deemed advisable to make routine Widals of various servants and employees. All the servants of the officers of the First Infantry, numbering 70, mostly Japanese, were examined, and the reactions were negative except in three cases previously vaccinated. On the supposition that a carrier might be found in the restaurants at Castner, Widals were made on specimens of blood from the seven Chinese employees of the First Infantry restaurant and the four Chinese employees of the Fourth Cavalry restaurant. The reactions were negative.

On February 20, a case having been found in the First Infantry tailor shop in the person of a Japanese, Widals were made on specimens of blood taken from the nine employees of this establishment The reactions were negative.

In addition seven Widals were made on Japanese found at the quartermaster camp connected with the building of the tunnels for the water supply and also on the five employees of the post dairy The reactions were negative.

Systematic attempts were made to isolate carriers by stool and urine examinations. Eight examinations were made for typhoid o paratyphoid in this manner of the employees of the First Infantry tailor shop; 2 cooks of K Troop, Fourth Cavalry; 3 cooks from I Company; 3 cooks from I Company; and 2 cooks from E Company

First Infantry. Later stools or urine were examined of 8 hucksters, Chinese or Japanese, and of 13 employees of restaurants, the latter comprising all the enlisted men on duty in the restaurants in whose cases the Widal reaction would be useless on account of typhoid immunization. Additional examinations were made of suspect carriers prior to the establishment of this board, after the occurrence of the disease in B., a civilian employee. Careful stool examinations were made of all cooks and mess attendants at the prison stockade mess, 8 in number, with negative results.

In summing up the findings of the board, the following general review is given:

The first two cases occurred on October 15, 1915, in two children, both 8 years of age and attending the district school, which is located n the Schofield Barracks section. No other cases occurred in this school. The two children went back and forth from school in different wagons.

The board has been unable to trace any connection between the two cases which occurred on October 15 and the four succeeding cases which occurred between October 25 and 28, 1915, but it believes that the same cause was common to the first six cases.

Following the discovery of typhoid fever in the son of Capt. F., stool examinations were made of Capt. F., who had typhoid fever n 1898, and also of O., a house servant. These were negative for typhoid bacilli and their respective Widals were also negative.

After close scrutiny of the foregoing data, the board can not decide even the probable origin of the disease.

It is recognized that a single examination does not decide whether an individual is or is not a carrier.

As far as examinations are concerned, the results indicate that here is no carrier among the dairy employees, the hucksters, and he post exchange employees.

The evidence throws suspicion on the water supply, but the epidemic was not of the explosive type characteristic of water-borne disease.

Even if the disease disappears coincidentally with the installation f a new and improved water-supply system, at the same time some arrier connected with the food-supply system may have left the post r been transferred to some other duty.

While the report is submitted with no conclusions reached, the oard believes that considerable valuable material has been collected nd made available, in case further cases should develop.

The surgeon, Schofield Barracks, in transmitting the report of the oard, remarks:

> Though positive proof is not available, the surgeon is strongly of the opinion that a apanese carrier was responsible for all the cases cited in this report.

PARATYPHOID FEVER.

One case of this disease occurred.

MALARIA.

Fifteen cases were reported during the year.

SMALLPOX AND VARIOLOID.

None occurred.

MEASLES.

Twenty-two cases of measles occurred with two deaths.

INFLUENZA.

This disease caused the highest number of admissions, venereal diseases excepted, 171 cases being reported, with an admission rate of 19.27 per 1,000.

DYSENTERY.

Owing to the number of cases of amœbic dysentery occurring during the year, 20 in number, a board was appointed consisting of thre medical officers to investigate and report upon the cause and submi recommendations for the prevention of this disease in the future The board met at Fort Ruger, Hawaii, April 25, 1916, and their con clusions and recommendations may be summed up as follows:

That amœbic, or more properly entamœbic, dysentery is no especially prevalent in Oahu, and while sporadic cases do originat in the island, it can not properly be considered as endemic.

That its apparent incidence is understood to result principally fro importation of chronic cases, carriers, and persons in long incubatio period (average 64.8 days).

That the "carrier" theory is the method in which entamœbi dysentery is disseminated, but that its transmission is still unde termined.

That infection usually occurs through the ingestion of cyst-bearin food and drink either directly or contaminated through handling by carrier, or indirectly contaminated by rodent, fly, or other inse transferences of cysts from infected stools to food, or by the use night soil or polluted water in irrigating and washing garden produc

That the life of the cysts of entamœbic histolytica in water or o vegetables before losing their infective power is not known at th time.

That the usual bacteriological and chemical examination of wat and milk would be useless in attempting to determine the presen or absence of these cysts, and that after an examination nothing mo conclusive than an opinion as to whether the water was polluted wi sewage could be given.

That the local sanitary defects noted at the different posts visit is not directly related to the occurrence of the cases considered, b that the more scrupulous the individual and organization hygie the less frequent will be the cases of entamœbic infection.

That the prominent part played by carriers should be constant borne in mind in determining the details of administration pertaini to food and its preparation.

That the immediate proximity of latrines to the kitchens as se in the new barracks at Fort Kamehameha is considered dangerous a likely to rapidly disseminate any intestinal disease that might g a foothold in the organization even if contrary to the present con tion, both kitchens and latrines were properly screened.

The board recommended that—

All cooks in organizations from which patients showing entamœba istolytica in their stools are received have their stools examined once month for three months thereafter.

All enlisted men, and especially noncommissioned officers, be intructed regularly in hygiene of entamœbic dysentery especially with egard to the danger from allowing men with histories of abdominal ramps, diarrheas, etc., who might be carriers, as cooks and kitchen olice.

All medical officers be instructed to prepare complete histories of ll cases diagnosed as diarrhea, intestinal fermentation, colitis, enteris, gastritis, ptomaine poisoning, gastroenteritis following the form utlined above and that the stools of such cases be examined repeatdly for entamœba histolytica as invariably as the Wassermann reacon is now being requested in cases of venereal sore.

Increasing efforts be made everywhere in garrison and in the field o make latrines, kitchens, and dining rooms flyless and flyproof. he importance of this can not, in the opinion of the board, be overmphasized and it believes that apparent compliance with but real ndifference to the thorough execution of these principles is a sanitary enace.

Experimental work be instituted to determine whether the rat is a arrier of entamœba histolytica, and how long the cysts of that paraite retain their infective power after leaving their host.

BRONCHITIS.

There were 263 cases of bronchitis with an admission rate of 29.63.

TUBERCULOSIS.

There were 31 cases, 28 of which were pulmonary tuberculosis.

VENEREAL DISEASES.

There was a considerable increase in the venereal rate for 1915 over 14, 850 cases in all occurring, with an admission rate of 95.76. f these cases 237 were syphilis, 96 chancroid, and 517 gonorrhea.

ALCOHOLISM AND ITS RESULTS.

There were 100 cases admitted for this cause, with an admission te of 11.27, which was slightly lower than for 1914.

DIARRHEA AND ENTERITIS.

Two hundred and thirty-four admissions are chargeable to this use, producing an admission rate of 26.36.

HEMORRHOIDS.

There were 55 cases admitted during the year.

MENTAL ALIENATION.

Thirty-nine cases of mental alienation were reported, resulting in admission rate of 4.39, an increase over last year.

SANITATION.

The following sanitary defects are reported by the department surgeon:

FORT ARMSTRONG.

Septic tank too small (January report). War Department declines to act, as it i the policy to remove command to Fort Kamehameha and retain only a caretake (fifth indorsement, Mar. 13).

FORT DE RUSSY.

The old and temporary buildings are to be replaced by new construction, for whic bids have been invited. Estimates have been made to properly fly-proof kitchen c Tenth Company, Coast Artillery Corps (December report).

FORT KAMEHAMEHA.

Authority has been given to correct faulty location of windows in permanent no commissioned officers' quarters if source of discomfort (special sanitary report, Mar. 12

From special sanitary report of November, it would appear that the plans of ne permanent barracks overlooked essentials of sanitation and that changes in origin plan further increased difficulties. This has been made the subject of investigatio and report of sanitary inspector and is now receiving the special attention of th department commander. It is not known by whom the original plans were drawn an approved, but one can not conceive them obtaining the approval of a sanitarian.

The filling of the near-by swamps is urged by the surgeon as a sanitary matter i December report, and as the labor and expense involved is great, will require th action of the War Department.

FORT SHAFTER.

The recommendation of the surgeon (March report) to hold recruits on mainla until all likelihood of introduction of infectious diseases is passed, is impracticab and inadvisable.

In August report the following defects are noted: No kitchen and dining room f band of Second Infantry. Room so used inadequate in size and so situated that du from grounds of quartermaster stables blows into door. This is awaiting action of W Department. Drainage ditch through post imperfect and should be cemented assure free flow of water and prevent breeding of mosquitoes. Cement is now availa and rock crusher of post has been repaired, so that work can be done with post la (December report). Imperfect sewage plant for the present and proposed future ga rison. The present plant was intended for one battalion at peace strength. Prese garrison: One regiment of Infantry, one company of Engineers, one company of Sig Corps, all at war strength. Future garrison probably will be one or two additio regiments. Estimates ($140,000) for a proper main sewage system are being prepar (December special report). This should be installed prior to permanent constructi September report shows the need for a proper dispensary building. The need acknowledged by the department commander, but not approved for a tempora structure, as estimates for a permanent post have been submitted for action of C gress (November report). Inadequate water-closet facilities in cantonment barrac This has received as yet no action.

SCHOFIELD BARRACKS.

The necessity of sanitary provisions in advance of the arrival of troops is shown the many defects noted in the reports of Schofield Barracks.

The shortage of water supply has been one of constant complaint. With the cem lining of the ditch from Koolau Range to reservoir, it is believed this will end. I thought that this cement lining of ditch would have been provided for in the beginn had a hydraulic engineer, familiar with Hawaiian conditions, been in charge. T isposal of sewage offers an opportunity for similar comment regarding the employment f a competent sanitary engineer in planning a comprehensive system provided fore nowledge is available of what the garrison is to be. Defects in this respect are noted ı sanitary report of September, and it is believed will continue until remedies prooosed are carried out. A proper plan of post would not have constructed noncommisoned officers' quarters in the proximity of septic tanks when so much other land is vailable.

The following recommendations of surgeon on December report await action of igher authority:

"(*a*) Barracks to be built to replace casual (quarantine) camp."

With a post the size of Schofield Barracks infectious diseases are almost sure to be rought with each lot of recruits from the mainland. Should the enlistment period e decreased, such arrivals will be more numerous and more frequent than in the ast, and the need of proper quarantine greater.

"(*b*) That a guardhouse be erected in place of the stockade camp for general prisners."

The recent severe storms have demonstrated the need for this.

"(*c*) That permanent roads be built to replace the quagmires now used as roads."

This only indirectly affects sanitation.

"(*d*) That the makeshift and partial sewer system be extended to all parts of the ost and completely modernized."

"(*e*) That the septic tanks of the sewage disposal plant be covered to prevent fly reeding."

These last two are covered by remarks above as regards a competent sanitary engineer rnishing a proper plan and strict adhesion thereto.

DEPARTMENT HOSPITAL.

Quarters for medical officers and noncommissioned officers of Hospital Corps are quired, as stated in January report. The War Department has been asked for the oney to buy adjoining land and Congressional action is sought. Until that time ıblic buildings will be inadequate for command and the officers be obliged to live om 3 to 10 miles from hospital.

SANITARY PERSONNEL.

With an increase of 13 medical officers, the complaint of last annual report as to arcity for peace conditions no longer holds. The Hospital Corps is deficient, espeılly in competent noncommissioned officers, of whom there are but 31. These, with e 185 privates first class and privates, including lance corporals and acting cooks, ve but 2⅓ per cent of the command, a number barely sufficient to do the ordinary ıtine work of hospitals and dispensaries and not having time to devote to the neces'y field instruction at Schofield Barracks and hospital training at department spital. Should an active campaign become necessary, this shortage would most 'iously affect the sanitary conditions and consequent morale of the troops.

The needs of the Medical Department for war in Hawaii were set forth in a report to e department commander under date of October 1, 1915.

INSTRUCTION OF PERSONNEL.

With the arrival (Jan. 15, 1916) of 25 recruits, Schofield Barracks will be enabled to 'e some needed field instruction. In January, 1915, a class of 10 men was formed department hospital from selected privates of the various stations for a course in rsing. These men were returned to their stations after four months' training and re given certificates of having completed such special course of Army nursing. port of school inclosed. In November another class of 10 was organized, a greater mber not being available. It is intended to continue this training for six months. e organization of the United States Service Medical Society of Hawaii, of which all nmissioned officers of the Medical Department (excepting three) are members, for discussion of medico-military matters, it is believed will be of benefit to the Army vice as well as individuals. Paragraph 45, General Orders, No. 2, Headquarters, waiian Department, July 1, 1915, has resulted in a better study, especially by ior medical officers, from a military sanitary point of the conditions liable to be t in war.

ntil ambulance companies are given this department, proper field training and sequent sanitary preparations can not be gained.

HOSPITALS AND DISPENSARIES.

The construction of a nurses' quarters and clinic building have given much-needed additions to the department hospital. The alterations of one of the buildings into prison and detention wards, with hydrotherapeutic section, is under way, and will permit better handling of cases for which instituted. A laundry should be provided. Quarters for commissioned and married noncommissioned officers is an urgent need. It is not known what progress has been made in obtaining the necessary land adjoining the hospital upon which these buildings can be erected, but the need therefor is great, and the expense to the Government in the form of commutations for quarters makes a considerable item. As it is, commissioned and noncommissioned officers are obliged to reside at distances of 3 to 8 miles from their work, are under expense in going to and fro, and are not as immediately available as though they lived nearer. The estimates for these 14 sets of officers' and 6 sets of noncommissioned officers' quarters call for approximately $75,000.

A 240-bed hospital should be one of the permanent structures at Schofield Barracks Estimates have already been submitted for a plan which can be readily expanded. I is understood that the Surgeon General has asked for $150,000 for this purpose.

The construction of the Iwilei prophylactic station has already been mentioned As it was occupied only subsequent to June 22, its workings can not be told.

Additional room for dental surgeons and a larger detachment of Medical Departmen is required at the Fort Kamehameha dispensary. Until such space is available, thi post can not be made a base dental station, and the people entitled to treatmen must, in many instances, go either to department hospital or department headquarter for proper treatment.

A proper dispensary is an urgent need at Fort Shafter. The present shack offer but poor facilities for doing the great amount of regular dispensary work of a statio having a strength approximating 2,000 with many families of officers and enliste men in addition. Should additional regiments be stationed at this garrison, it i recommended that additional dispensaries be provided.

The establishment of a medical supply depot by authority of Secretary of Wa (Dec. 9, 1915), and actual organization in March, 1916, has added much to the pre paredness of the medical department in case of emergencies. Suitable storehouse and offices are needed. The reserve supplies, valued at approximately $105,000, hav not been entirely overhauled since their receipt in these islands in 1910, and this work hampered by reason of lack of room, and, in the past, shortage of help. In 1915 th leather equipments of the ordnance department for sanitary field units were ove hauled, and it was estimated that they had deteriorated many per cent (20–40 The condition of canvas and cloth material is not known. Stored as it has been i the past, and still is, in all kinds of structures, and wherever space is available, has n been in the interest of economy. Undoubtedly much of the medical supplies a deteriorated. As the advance copies of Manual Medical Department, which mak changes in supply tables, has just been received, these units will be overhauled earliest practical opportunity and be brought up to date. But proper storage facil ties must be provided. To have an efficient department of any kind requires prop personnel, with sufficient time to train, needed matériel stored and assembled whe it can be safeguarded and issued, and, in the case of the Medical Department, prop hospital facilities. In all these respects there is much lacking, and efforts to secu the same have met with only partial success.

PANAMA CANAL ZONE.

The mean strength of all troops, including officers, serving in the Panama Canal Zone during the year was 5,903, as compared with 2,076 for 1914.

ADMISSION RATES.

The admission rate for all causes was 859.22, that for disease being 709.81 and that for external causes 149.41, as compared with 938.35, 818.88, and 119.46, respectively, for the year 1914.

The diseases causing the highest admission rates were: Venereal diseases, 132.48; malarial fevers, 85.55; influenza, 46.76; bronchitis, 29.65; tonsillitis, 29.14; and furuncle, 26.09.

It is considered worthy of comment to call attention to the remarkable reduction in the malarial fever rate from 205.20 in 1914 to that given above, which would indicate that mearures looking to the protection against and destruction of mosquitoes are effective, if properly carried out.

Admission rates for some of the principal diseases for Panama Canal Zone, American troops, officers and enlisted men.

	Officers and enlisted men.		Enlisted men.	
	1915	1914	1915	1914
Venereal diseases	132.48	131.50	136.51	135.82
Malarial fevers	85.55	205.20	87.57	208.96

Tables Nos. 44 and 73 give the figures for all troops serving in the Canal Zone, including officers, and Table No. 76 gives the rates for enlisted men only.

DISCHARGE ON CERTIFICATE OF DISABILITY.

The rate for discharge on certificate of disability was 13.03, as compared with 10.94 for 1914.

DEATHS.

The death rate for all causes was 2.46 per 1,000; that for disease being 1.31, and for external causes, 1.15. In all there were 15 deaths, 7 of which number were attributable to external causes.

TABLE No. 44.—*Movement of sick in Panama Canal Zone, years 1915 and 1914, officers and enlisted men, American troops.*

	Years.	From all causes.		Excluding injuries, venereal diseases, alcoholism, and vaccinia.	
		Total.	In hospital.	Total.	In hospital.
Ratio per 1,000 of mean strength:					
Admissions to sick report	1915	859.22	471.62	561.75	....
	1914	938.35	709.54	677.75	....
Discharges on certificate of disability	1915	13.03	....	11.00	....
	1914	10.94	....	9.04	....
Deaths	1915	2.46	....	1.31	....
	1914	3.21	....	.46	....
Total losses	1915	15.15	....	12.31	....
	1914	14.15	....	9.50	....

	1914	36.45	27.47	25.88	19.28
Average number of days lost:					
For each soldier	1915	9.35	5.75	5.99	3.80
	1914	13.30	10.02	9.45	7.04
For each case	1915	10.89	12.18	10.66	....
	1914	14.18	14.13	13.94	....

PORTO RICO.

The troops are all recruited from and partly officered by native Porto Ricans. The regiment is commanded by a United States Army officer. The sanitary work in connection with this organization is in charge of a medical officer from the regular corps and a medical officer from the Medical Reserve Corps. The two garrisoned posts have a mean strength of 719 officers and men.

ADMISSION RATES.

The admission rate for all causes in 1915 was 552.16, as compared with 615.28 in 1914; for disease, 496.52 as compared with 534.65, and for external causes, 55.63 as against 80.62 in 1914.

An improvement in health conditions among the troops is evidenced by the reduction in the rates for 1915 over the year 1914. It is regrettable that the rate for venereal diseases is higher this year, as compared with 1914 which showed an appreciable reduction over 1913, these diseases causing the highest admission as well as the highest noneffective rate, dengue fever taking second place, with rates of 84.84 and 76.50 per 1,000, respectively.

NONEFFECTIVE RATES.

The noneffective rate for all causes is also slightly higher than for the preceding year, being 22.36 for 1915, as compared with 21.64 for 1914. The rate for disease was 20.57, as compared with 18.93 for 1914.

It will be noted that there was a marked decrease in the malarial rate.

Some of the principal diseases, with the admission and noneffective rates as compared with the preceding year, are shown in the following tabulation:

Admission and noneffective rates per 1,000 of mean strength for the most prevalent diseases among officers and enlisted men in Porto Rico.

	Admission rates.		Noneffective rates.	
	1915	1914	1915	1914
Venereal diseases	84.84	66.48	4.57	3.84
Chancroid and results	26.43	16.97	1.68	1.19
Gonorrhea and results	33.38	18.39	1.56	.75
Syphilis and results	24.90	31.12	1.33	1.89
Dengue	76.50	8.49	3.94	.11
Acute abscess and cellulitis	44.51	50.92	1.16	.90
Diseases of the lymphatic system	31.99	19.80	1.06	.71
Rhinitis, acute	26.43	115.98	.40	1.38
Furuncle	23.64	15.56	.45	.38
Dysentery	22.25	7.07	.56	.21
Diarrhea and enteritis	19.47	36.78	.37	.75
Rheumatism, muscular	11.13	9.90	.19	.28
Malarial fevers	8.34	12.73	.34	.23
Febricula and undetermined fevers	6.95	1.41	.12	.02
Rheumatism, articular (all)	5.56	11.32	.42	.32
Ankylostomiasis	5.56	5.66	.26	.33
Tonsillitis	2.78	12.73	.05	.16
Smallpox	1.39	2.83	.22	.17
Tuberculosis	1.39	1.41	.18	.43

DISCHARGES ON CERTIFICATE OF DISABILITY.

The rate for discharge for disability was 7.34 per 1,000 for disease for 1915, as compared with 8.97 for diseases in 1914.

DEATHS.

The death rate was 4.17 per 1,000, there being three deaths during the year, two due to disease and one to injury. In 1914 there were also three deaths, all due to disease.

SPECIAL DISEASES.

YELLOW FEVER.

The surgeon at San Juan, P. R., in September, 1915, called attention to the existence of several cases of febrile disease coming under his observation and resembling in certain features, yellow fever. He expressed the opinion that the so-called "seven-day fever," "dengue," and "black-water fever" as they exist in Porto Rico, were possibly all closely related to yellow fever, and accordingly so tentatively diagnosed his cases.

On further study the diagnosis of yellow fever in these cases was not confirmed by either the local health authorities or by the Surgeon General of the Army, who in person investigated the matter very thoroughly upon the request of the Bureau of Insular Affairs.

CHINA.

The mean strength of all troops, including officers, serving in China during 1915 was 1,378. This force consisted of Infantry, a detachment of Signal Corps, Hospital Corps, and noncommissioned staff, all white.

ADMISSION RATES.

The admission rate for all causes was 1,438.32, that for disease 1,328.74 and that for external causes 109.58, which are, with the exception of the latter, all higher than for the year 1914. The diseases causing the highest admission and noneffective rates are shown in the following tabulations:

The principal diseases for China—Admission rates for American troops, officers and enlisted men.

	Officers and enlisted men.		Enlisted men.	
	1915	1914	1915	1914
Venereal diseases	488.39	381.30	504.12	396.37
Constipation	80.55	50.00	83.15	56.35

Pleurisy	.23	.01	.24	.01

DISCHARGE ON CERTIFICATE OF DISABILITY.

The discharge rate for disability was 9.74 per 1,000 for all causes.

DEATHS.

The death rate was 4.35 per 1,000, the rate for disease being 2.90, and that for external causes 1.45. The death rate was lower than for 1914, being 5.50 for the latter year.

Tables Nos. 3, 73, and 76 give all figures for the troops serving in China for the year 1915.

The rates would indicate that the general health conditions have decidedly deteriorated during the year 1915, although not so marked as last year (1914) over 1913. An appreciable increase in the admission rate for venereal diseases is noted, with a decrease, however, in the noneffective rate for the same disease.

TABLE NO. 46.—*Comparison of rates for the several countries garrisoned by the United States Army.*

COMPARISON OF RATES (PER 1,000 OF MEAN STRENGTH) YEARS 1914-15, OFFICERS AND ENLISTED MEN.

ARMY TRANSPORTS.

The sanitary condition of the Army transports and the accommodations provided for troops and passengers have been satisfactory.

With one exception, hospital accommodations were reported ample. On the homeward voyage of the *Sheridan* in April and May, 86 patients were received by transfer from Manila and Honolulu, in addition to the casuals admitted from time to time from command, necessitating the placing of 20 or more patients in the troops quarters of hold.

During the voyage of the *Sherman* from San Francisco to Manila in January, 16 cases of mumps and 19 cases of measles occurred. On the next voyage of the same transport in April, 22 cases of mumps and 3 cases of measles developed.

Twenty-six cases of mumps developed on the transport *Thomas* between February 5 and March 8 while en route to Manila. One case occurred at Manila, and one case during the return voyage.

A case of smallpox was found among casuals coming from Fort Mills, P. I., on October 14, prior to the sailing of the *Logan* from Manila. The patient was taken to the San Lazaro Hospital, and isolation ward and quarters of casuals disinfected.

The following is a statement of enlisted men carried between the several ports during the year:

San Francisco to Honolulu	3, 978
San Francisco to Manila	5, 445
Honolulu to Manila	106
Manila to Nagasaki	8
Manila to Honolulu	21
Manila to San Francisco	6, 397
Honolulu to San Francisco	1, 946
Nagasaki to San Francisco	273
Total	18, 174

Some difficulty has been experienced by transport surgeons in obtaining from the casual officer, prior to arrival at port of destination, the health records (descriptive lists) of enlisted men from the Navy and Marine Corps given transportation on Army transports. This office has recommended that health records be sent to the ship's surgeon instead of to the casual officer.

GENERAL HOSPITALS.

LETTERMAN GENERAL HOSPITAL, SAN FRANCISCO, CAL.

This hospital is used as a base hospital for the Philippines and Hawaii; a post hospital for the Presideo, San Francisco, Fort Winfield Scott and several smaller posts in the harbor of San Francisco, and a general hospital for the western part of the country. It is the largest general hospital in the Army.

During the year the following new buildings have been completed: Addition A to nurses' dormitory, ward for special surgical cases, garage, and storehouse for combustibles.

The number of patients admitted during the year, including civilians and general prisoners, was 3,195, being an increase of 178 over the preceding year. There were 183 cases remaining in hospital December 31, 1914, making a grand total of 3,378 patients treated in the hospital during the year. Of this number 2,433 were officers and enlisted men, 46 general prisoners, and 899 others. There were 1,940 medical cases, 907 surgical, 293 venereal, and 234 mental. The daily average number of patients was 283.86. Of this number 21.28 were officers, 214.38 enlisted men, 4.63 general prisoners, and 43.58 others. The average number of days in hospital for each case was as follows:

	Officers.	Enlisted men.	General prisoners.	Civilians.	
				Male.	Female.
Medical	46.00	34.83	26.45	20.75	17.00
Surgical	56.58	21.17	46.36	15.23	11.89
Venereal	74.00	34.10	50.50	35.77	21.00
Mental	58.00	65.61	130.00	26.62	4.00

The following tables show the movement of the sick, together with the principal sources of admission, during the calendar year 1915:

	Officers and enlisted men.	General prisoners.	Civilians.	Total.

Remaining, 1915	272	9	53	334
Total	2,433	46	899	3,378

There were 72 deaths in all during the year, 35 officers and enlisted men, 1 general prisoner, and 36 civilians and others. The principal causes for these deaths are given below:

Tuberculosis of the lungs	8
Cancers and other malignant tumors	4
Simple peritonitis (nonpuerperal)	4
Bright's disease	4
Purulent infection and septicemia	3
Organic diseases of the heart	3
Broncho-pneumonia	3
Diseases of the intestines	3
Simple meningitis	2
Cerebral hemorrhage (traumatic)	2
Pericarditis	2
Pneumonia (lobar)	2

In addition to the above list 4 civilians were suffocated in burning building.

There were 474 discharged on certificate of disability. Of this number 403 were not in line of duty and 71 in line of duty. The principal causes were as follows:

Mental alienation	125
Diseases of the organs of locomotion	65
Tuberculosis of the lungs	39
Epilepsy	24
Organic diseases of the heart	23
Other diseases of the nervous system	16
Other external violence	16
Syphilis	14
Neuralgia and neuritis	12
Diseases of the bladder	12
Gonococcus infection	10
Diseases of the joints	10

The following is a statement of the admissions and dispositions of insane patients during the year:

Movements of the insane.

Disposition.	Officers and enlisted men.	General prisoners.	Others.	Total.
Returned to duty	9	2		11
Left hospital			3	3
Discharged on certificate of disability at this hospital	130			130
Died	2		2	4
Transferred to recruiting officers for disposition	8			8
Transferred to the Government Hospital for the Insane	21			21
Sent home for discharge	6			6
Discharged without honor for fraudulent enlistment	1			1
Total	177	2	5	18

An active surgical clinic is maintained at this hospital, the following being a condensed tabular statement of the surgical operations:

Operations.

Operations.	Officers.	Enlisted men.	Total.	Retired officers.	Retired enlisted men.	General prisoners.	Army Nurse Corps.	Civilians.	Total.	Grand total.
Cranium		2	2							2
Face		1	1					1	1	2
Neck		5	5		2			7	9	14
Upper extremity		21	21	1		1		12	14	35
Thorax		7	7	1	1			3	5	12
Abdomen (laparotomy)	9	106	115	2	4	6	2	86	100	215
Genito-urinary	4	35	39	1		3		18	22	61
Rectum and anus	6	30	36		1			11	12	48
Gynecological, internal							1	64	65	65
Gynecological, external								61	61	61
Lower extremity	18	50	68		1			17	18	86
Major (not included)								3	3	3
Minor (not included)	2	76	78		6	16		38	60	138
Obstetrical								29	29	29
Total	39	333	372	5	15	26	3	350	399	771

Seven hundred and seventy-one operations were performed, as against 528 last year (the eye, ear, nose, and throat cases not included), an increase of 243. In addition and not listed in the above statement, there were 5,165 dressings done and emergency cases treated in the dressing room of the operating pavillion, and 8,240 in the dressing room of the surgical ward for infected cases. There were also made 163 gynecological and obstetrical examinations. There was a total of 50 confinements cared for during the year, one of which, puerperal eclamptic case, resulted in death.

On September 6, 1915, orthopedic work was begun and 42 cases were treated.

The following is a statement of the work done in the eye, ear, nose, and throat clinic:

	Hospital cases.	Out cases.	Total.
Officers	68	124	192
Enlisted men	501	296	797
Families of officers and enlisted men	184	422	606
Civilian employees	11	46	57
Army Nurse Corps	1	66	67
Civilians, including Civil War veterans	35	83	118
Total	800	1,037	1,837

There were 1,837 cases treated, and 463 operations performed during the year.

There were 368 cases of all classes refracted.

The dentist on duty at the hospital reports 1,248 persons treated for affected teeth, with 3,363 sittings.

A large department laboratory is maintained for the use of the hospital and for the special work of the posts in the Western Department. The report of the work done will be found under the general head of "Laboratories."

The mean strength of the personnel on duty at this hospital for the year was:

Officers	12.10
Dental surgeons	2.02
Acting dental surgeons	.09
Army Nurse Corps	43.56
Hospital Corps	162.00

There were 27 civilians employed by the Medical Department, and 11 by the Quartermaster Corps on duty in the hospital during the year.

WALTER REED GENERAL HOSPITAL.

This hospital is located at Takoma Park, D. C., near the northern border of the District. It serves as the general hospital east of the Mississippi and as the post hospital for Washington Barracks. The patients from the latter place are transferred in automobile ambulances of which this hospital has, at present, four, while another is being constructed.

As heretofore, there are but two sets of officers' quarters at the hospital, although nine medical officers are assigned to duty there. The rental of quarters for these officers is an item of large expense and results in their being unsatisfactory and inconveniently housed both for their comfort and their work.

The reservation and buildings are kept in good condition, though improvements are needed on the roads and it is hoped that they can be accomplished during the coming spring or summer. An improvement recently completed is a new concrete roadway back of the main hospital building, which, together with its drainage system, serves not only to make the service of wagons easier and cleaner, but also to divert much surface drainage that formerly ran directly toward, and partly through or into the basement.

Two new wards for enlisted men have been opened since the time of the last annual report, and are found very satisfactory. Another small ward is completed and available for use but it has not yet been put into use. Work is progressing on a basement ward to be used for psychopathic cases, and it should be completed by March.

The X-ray laboratory has been remodeled and the following improvments made:

(1) Additional apparatus installed—Coolidge tube, verticle roentgenoscope, overhead wiring system, Alberene tank, illuminating viewing box.

(2) Complete renovation of X-ray room; installation of labyrinth to dark room.

(3) Two hundred and twenty-four cases were X-rayed (some retaken many times for comparison). Excellent work is now being done.

The laboratory does only simple routine work for clinical purposes, all Wassermann tests, blood cultures, laboratory examination of pathologic specimens, and other special work being done at the Army Medical School. It would not be possible to do it all here without an increase of personnel, and the school's work is very satisfactory.

Requisition has been made for apparatus and supplies that will permit of the undertaking of the new work on blood chemistry especially in cases of renal disease, which is now coming into use. This work will be taken up as soon as possible.

The hydrotherapeutic department has been put to much use of late and has proven very satisfactory. At present the hospital is fortunate in having the services of an enlisted man who is skilled in that work. He receives extra pay from the hospital fund. It is desirable and just that the Government should allow extra pay for the position. The work is arduous as well as skilled and is entirely for the benefit of the Government, not for the benefit of the detachment on duty here, whose fund now pays.

A similar opinion is entertained as to the pay of maids for work in the rooms of women patients. Maids are necessary, the detachment (soldiers) can not be expected to work in women's rooms, yet their fund pays for maids.

The hospital messes, both for sick officers and for enlisted men are excellent. It is doubted if they could be much better. They are now run at very much lower cost than formerly.

The discipline is, in general, very good, but the hospital's nearness and convenience to a metropolis and the monotony of sickness make for derelictions in the way of drink by too many Hospital Corps men and patients. Increased efforts are to be made to provide interest and amusement at the hospital. It is thought that a gymnasium should be established for the use of men on duty here. Among these are some excellent enlisted men, but many are not of as good type as could be desired. It is doubted, however, if the average can be made higher while the pay remains what it is now.

In view of the certain increase in the use of automobile ambulances, it is desirable that there be established the grade of chauffeur sergeants in the Hospital Corps.

There is a shortage of one man in the personnel of the Quartermaster Corps at this station. The allowance of 12 men for this post is inadequate, necessitating the detail of 6 Hospital Corps men for this duty.

The work of the hospital is somewhat interfered with by details of officers to work outside the hospital, such as instruction work at the Army Medical School. These details have not in any way interfered with the adequate and proper care of the sick, but they do occasion inconvenience in such internal matters as officer-of-the-day duty, instruction of the Hospital Corps, disability boards, consultation boards and committees and attendance at Journal club and clinical meetings. These last two duties have been added within a few months to those formerly obtaining. They are thought to be helpful to the medical officers as well as beneficial to the patients, and to make for the increased efficiency of the hospital. The clinics have also been attended by the postgraduate students at the Army Medical School. Medical and surgical clinics are held alternately.

The members of the Army Nurse Corps on duty here have in general rendered excellent service. The number of nurses is adequate for ordinary duties but is a bit small for times of stress and to provide for sickness among the nurses and for their leaves of absence.

Because of the peculiar plan of this hospital, nursing is arduous here and a larger proportionate number of nurses is needed than in a hospital built on the Letterman plan.

The number of patients admitted during the year, including civilians, was 1,175. This was an increase of 191 over the preceding year.

The average number of days in hospital for each case was as follows:

	Officers.	Enlisted men.	Civilians.	
			Male.	Female.
Medical	35.23	22.23	18.08	15.00
Surgical	21.82	38.13	9.19	15.94
Venereal	11.50	40.54	21.00	....
Mental	24.00	44.75	13.00	....

The following table shows the movement of the sick, together with the principal sources of admission, during the calendar year 1915, including civilians. No general prisoners were admitted.

	Officers and enlisted men.	General prisoners.	Civilians.	Total.
Admissions:

Total	846	....	422	1,268

There were 24 deaths. Of this number 12 were enlisted men, 3 were retired officers, 1 a retired soldier, 7 civilians, and 1 member of the Army Nurse Corps.

The following were the causes of death:

Post operative shock	3	Pernicious anemia	1
Diabetes, mellitus	2	Aortic regurgitation	1
Nephritis, parenchymatous	2	Cancer of stomach	3
Nephritis, interstitial	2	Aortic aneurism	1
Lobar pneumonia	1	Ataxic paraplegia	1
Sarcoma	2	Broncho pneumonia	1
Tumor of cecum	1	Cerebral hemorrhage	1
Tuberculosis, pleural cavities and peritoneum	1	Renal insufficiency and tuberculosis of lungs and bladder	1

There were 64 discharged on surgeons' certificate of disability. Of this number 40 were in line of duty and 24 were not in line of duty.

Gymnasium	1,164
Number of patients treated	156
Patients remaining under treatment, Dec. 31, 1915	27
Total	183

Two attendants, members of the Hospital Corps, gave the treatments the greater part of the year. During the summer only one attendant was available. One of the present attendants is very proficient. His assistant is still under instruction.

The following is a statement of the work done in the eye, ear, nose, and throat clinic:

Officers and enlisted men	408
Families of officers and enlisted men	154
Civilian employees of the Government	14
Army Nurse Corps	6
All others	28
Total patients treated during 1915	610

Personnel on duty at hospital.—The mean daily strength of the personnel on duty during the year was as follows:

Medical officers	10.96
Post noncommissioned staff	1.00
Hospital Corps and Quartermaster Corps	123.38
Army Nurse Corps	24.33
Mean aggregate	159.67

The character of the personnel received at this post (28 recruits) was not satisfactory. Facilities for drill and instruction as Hospital Corps men are lacking, and the multiform duties require men of service and above the average.

GENERAL HOSPITAL, FORT BAYARD, N. MEX.

The general hospital at Fort Bayard is devoted to the treatment of pulmonary tuberculosis in soldiers and in beneficiaries of the soldiers' home.

Fort Bayard is situated in Grant County, N. Mex., in the extreme southwestern part of the State. On account of the southern location of the hospital, it is generally assumed by those unfamiliar with the local conditions that the climate is very warm. But the altitude, 6,165 feet, largely counterbalances the influence of the southern sun and renders the climate cool rather than warm. The usual vicissitudes of the seasons are experienced. In the winter there is occasional snow; frosts occur nearly every night, rarely there is severe cold approaching the temperature of zero Fahrenheit, but such cold is of brief duration. On the whole, the winters are relatively warm, dry, and clear. In summer the heat is tempered by the dryness of the air, with the resulting diathermancy. The fact that summer is the time of the chief precipitation also exercises an important effect upon the temperature, clouds and rain very frequently being present during what would otherwise be the hottest portion of the days. These factors result in producing singularly cool weather, the summer being far more comfortable for the human organism, whatever the thermometer readings, than that of the greater part of the Northern States of the East and of the Mississippi Valley. For the treatment of tuberculosis, the peculiar excellence of the climate of Fort Bayard consists in the fact that it is one that avoids harmful extremes of temperature, yet in its diurnal and annual variations affords a sufficient stimulus to the human organism to favor activity of the metabolic processes.

An additional ward for ambulent patients is under construction. This building consists of a central structure containing offices and storerooms, with two wings used as wards. The material used is cement brick pebble dashed, with tile roof. The capacity of the building is 40 patients.

The number admitted during the year, including beneficiaries of the soldiers home, civilians, and general prisoners was 738, being an increase of 7 over the preceding year. The average number of days in hospital for each case was as follows:

	Officers.	Cadets.	Enlisted men.	Beneficiaries of the soldiers, home.	General prisoners.	Civilians.	
						Male.	Female.
Medical	125.79	281.67	109.56	134.26	57	103.41	57.1
Surgical			20.69			18.00	16.8
Venereal			23.75				
Mental			(1)				

(1) One tuberculous case later developed insanity and is counted among the medical.

The following table shows the movement of the sick, togethe with the principal sources of admission during the calendar yea 1915, civilians and general prisoners being included:

---

[1] By "completed cases" are meant all cases which have terminated their connection with the hospi in any way.

[2] Includes 75 cases under treatment less than 1 month.

The mean daily strength of the personnel on duty during the year was as follows:

Medical officers	11.79
Other officers	1.46
Post noncommissioned staff	1.89
Hospital Corps and Quartermaster Corps	148.35
Army Nurse Corps	22.31

ARMY AND NAVY GENERAL HOSPITAL, HOT SPRINGS, ARK.

This hospital was originally intended especially for patients having diseases in which hydrotherapeutic treatment is indicated. Paragraph 1441, Army Regulations, 1913, states that—

> The Army and Navy General Hospital, Hot Springs, Ark., is under the direction f the Secretary of War and is devoted to the treatment of the officers and enlisted men of the military and naval service of the United States, cadets at the United States Military Academy, officers of the Revenue-Cutter (now Coast Guard) Service, officers f the Public Health Service, and honorably discharged soldiers and sailors of the Regular and Volunteer Army and Navy of the United States, for such diseases as the waters of the hot springs of Arkansas have an established reputation in benefiting.

This hospital has served in part as a general hospital for the Southern Department and for the Second Division.

An addition to the bathhouse has been completed to accomodate fficer patients, being fitted with up-to-date therapeutic equipment, he flooring constructed of tile and the wainscoting and partitions of marble.

The Hospital Corps barracks, which was completed during November, 1915, is designed to accomodate 60 men and contains reading oom, barber shop and post exchange in the basement.

The double set of noncommissioned officers' quarters has been ompleted.

An addition to ward building Nos. 3 and 4 has been built, thus ncreasing the bed capacity of the hospital by 50 beds. It is purposed o use a section of this addition for convalescent officer patients, hereby increasing the facilities for caring for this class of patients y 10 beds.

A diet kitchen has been added to Ward No. 1, so as to facilitate the erving of this ward, in which are treated the most serious cases dmitted to the hospital. This addition, 20 by 20 feet, has a tile oor and tile wainscoting, and is equipped with gas range, water eater, dish washer, food warmers, etc.

An operating suite has been completed which is connected with the dministration on one side, and with ward 2 on the other, so as to ake it accessible to both the officers' section and the surgical ward. his addition contains a modern operating room, tiled throughout, ith skylight, electric overhead light, and electric wall outlets for the se of special electrical instruments during operations. The sterizing room is equipped with a new combination sterilizer outfit, three odern lavatories for hand sterilization and new instruments and ressing cabinets. In addition there is an etherizing room and a urgeon's dressing room.

Among other improvements made during the year may be mentioned the laying of tile floors in the toilet rooms of wards 1 and 2, eplacing with Vermont marble the old slate partitions to stalls and rinals replaced with floor appliances; wooden floors in lavatories of wards 2 and 3 replaced with tile, tile wainscoted, and old lavatorie replaced by modern type, while each new building in connection wit the hospital has been connected with the post system of drainage fire mains, roads, walks, mineral water, steam heat, sewers, electri lights, and in the case of the operating room and noncommissione officers' quarters with gas and city water, to complete which considerable construction work was required.

The total number of admissions during the year was 860, an increas of 75 over the preceding year. Of this number 58 were officers, 16 enlisted men, 9 retired officers, 43 retired enlisted men, and 581 civilians, including honorably discharged soldiers and sailors of the Army Navy, and Marine Corps. The daily average number of patient treated in hospital was 102.25.

The following tables show the principal causes of admission an method of disposition of all cases:

Remaining in hospital Dec. 31, 1914		11

DEATHS.

Eighteen deaths occurred during the year, including one officer nd one enlisted man on the active list of the Army (all others civilian atients), from the following causes:

rcinoma of upper right quadrant of abdomen, involving right kidney [1]	1
ost operative shock following gastro-enterostomy and appendectomy [2]	1
ncer of the stomach	1
ost operative shock following amputation of right thigh	1
remia	2
neumonia, catarrhal	1
pticemia	1
iabetes, mellitus	1
ephritis, parenchymatous	1
uberculosis of the lungs	1
rcinoma, gastric, pyloric	1
trophic cirrhosis and endocarditis	1
yphilis, tertiary (Gumma of the lungs)	1
obar pneumonia	1
ecrosis head of first metatarsal bone, following senile gangrene of great toe, right	1
roncho-pneumonia	1
rteriosclerosis	1
Total deaths	18

DISCHARGES FOR DISABILITY.

During the year 29 enlisted men were discharged on account of sability; the causes were distributed as follows:

phritis, interstitial, chronic	3
phritis, parenchymatous, chronic, and adhesions to cecum, following appendectomy	1
phritis, parenchymatous, chronic	1
thritis, infectious, multiple, chronic	1
thritis, chronic, right knee	1
thritis, gonorrheal, chronic, metatarso-phalangeal joints, both feet	1
thritis, chronic, affecting lumbar vertebræ	1
thritis, chronic, left sacro-iliac joint	1
uritis, subacute, involving right brachial plexus	1
uritis, traumatic, right ulnar nerve	1
uritis, chronic, right radius	1
uritis, chronic, traumatic, left external popliteal nerve, with motor paralysis	1
uritis, traumatic, right knee	1
lyarthritis, chronic, both knees, both ankles, and both wrists, caused by septic infection from wound on web of right thumb	1
at feet	1
rcoma of right kidney	1
philis, intractable	1
ostosis, planter surface of os calcis, bilateral	1
ralysis, partial, left lower limb, following anterior polyomyelitis	1
ralysis of circumflex of right brachial plexus, post syphilitic, with resultant loss of motion in right shoulder	1
ychasthenia, with tendency to self-depreciation and introspection	1
eumatism, articular, chronic, general, and endocarditis, rheumatic, chronic	1
eumatism, chronic, gonorrheal	1
tral stenosis, post rheumatic	1
stritis, chronic, catarrhal, and neuritis left brachial plexus	1
novitis, chronic, right knee	1
ibetes, mellitus	1
Total discharges for disability	29

Total	2,262

PERSONNEL ON DUTY AT HOSPITAL.

The mean daily strength of the personnel on duty during the year as as follows:

dical officers	5.78
her officers (dental surgeon)	.03
st noncommissioned staff	1.00
spital Corps and Quartermaster Corps	71.80
my Nurse Corps	7.32
Mean aggregate	85.93

DEPARTMENT HOSPITAL, MANILA, P. I.

This hospital is the general hospital for the Philippine Department. differs from the general hospitals in the United States in that it not directly under the control of the Surgeon General, but owing its geographic location it is under the authority of the department mmander.

The addition over the officers' ward, to serve as an accommodation for women and children, has been completed, and occupancy took place July 30, 1915. This addition consists of one large ward divided into 10 rooms, is screened and well ventilated on all sides, and has direct communication with the operating room by an electric elevator. Bathrooms adjoin the ward.

An item for painting the outside of all buildings, except recent new construction, was included in the annual estimates for the fiscal year 1916, and the work is now being done. The material for screening the venereal ward has been furnished and the work commenced.

A cement water tower with a 10,000-gallon tank is in course of erection on the eastern part of the hospital grounds to furnish artesian water for use of the hospital from a well 760 feet deep, which it is expected will furnish 25 gallons of water a minute. Upon the completion of this tower the distilling plant will be discontinued.

An alteration much needed at the hospital is another room in the administration building for use as a library and reading room fo medical officers. Such a room might be provided by cutting the commanding officer's and the adjutant's offices in two by a partition or preferably by putting a second story on the whole administratio building. This item will be taken up on the annual estimate.

During the year 1915 2,510 cases were admitted to hospital, o which number 82 were officers, 1,750 American enlisted men, 8 Philippine Scouts, and 591 civilians. Of the entire number 1,61 were medical, 899 surgical cases. The total daily average numbe of patients in hospital was 96.25. Of this number 4.10 were officer, 70.89 American enlisted men, 6.10 Philippine Scouts, and 15.1 civilians.

The following table shows the movement of the sick, together wit the principal causes of admissions, during the year 1915:

	Officers.	Enlisted men (American).	Philippine Scouts.	Civilian
Admissions:				
For gunshot wounds	....	2	....	....
Diarrhea and dysentery	3	10	....	-
Malarial fevers	6	17	8	
Typhoid fever	....	....	....	
Rheumatic affections	....	24	1	
Venereal diseases	3	234	6	
Injuries	6	134	9	
Insanity	1	57	6	
Alcoholism	....	49	....	
All other causes	63	1,223	57	4
Total	82	1,750	87	5
Dispositions:				
Returned to duty	76	1,292	46	
Discharged on certificate of disability	....	1	33	....
Discharged per expiration of term of service	....	2	1	....
Discharged per general court-martial	....	1	....	....
Deaths (all causes)	....	3	2	
Transferred to other hospitals	11	465	1	
Otherwise disposed of	....	....	....	
Total	87	1,764	83	

Total admissions during the year	2,
Remaining on sick report Dec. 31, 1914	
Total to be accounted for	2,
Total dispositions during the year	2,
Remaining on sick report Dec. 31, 1915	
Total accounted for	2,

The following tabulation shows the deaths, with causes, for the year 1915:

Cause.	Enlisted men (American).	Philippine Scouts.	Civilians.
Asphyxia during labor, due to inspiration of amniotic fluid			1
Broncho-pneumonia, acute			2
Cardiac dilatation			1
Ether anesthesia and operative shock			1
Exhaustion and hemorrhage from gums, due to spleno-myelogenous leukemia		1	
Gastroenteritis, acute, catarrhal			1
Hemorrhage from bowel, due to typhoid fever			1
Impetigo contagiosum			1
Obstruction of duodenum by constriction from ulcer		1	
Oedema of the brain, alcoholic			1
Premature birth			1
Rupture of saccular aneurysm of ascending arch of aorta	1		
Septicemia following acute suppurative ethmoiditis and empyemia of antrum of Highmore	1		
Shock and internal hemorrhage (abdominal) following traumatic injury			1
Toxæmia and exhaustion following pyemia	1		
Toxæmia following carcinoma of liver			1
Total	3	2	12
Aggregate			17

American soldiers are not discharged for disability in the Philippine Islands except in very rare cases; there was one discharge there n 1915. All the native enlisted men physically disabled for service are discharged in the islands. The following table shows the number discharged, with causes therefor:

	American troops.	Philippine Scouts.
Per expiration of term of service	2	1
ertificate of disability	1	33
Per general court-martial	1	
Total	4	34

Causes of disability.

Aneurysm, saccular, transverse portion of arch of aorta	1
Ankylosis, right knee joint, sequel to gonorrheal arthritis	1
Bronchial asthma and pulmonary emphysema	1
Cataract, cortical, immature, right eye	1
Defective mental development	4
Dementia precox	4
Keratitis, chronic, affecting upper half of right cornea	1
Lateral curvature of spine, congenital	1
eprosy	1
euritis, multiple, chronic, involving upper and lower extremities	1
Tuberculosis, pulmonary, chronic	16
Tuberculosis, pulmonary, chronic, and tuberculosis of pleura	2
Total	34

In 1914 there were 41 discharged for disability at this hospital.

An active surgical clinic is maintained at this hospital. The following is a condensed tabular statement of surgical operations during the year 1915:

Operations.	Officers and enlisted men (American).	Philippine Scouts.	Total.	Civilians.	Grand total.
Cranium				1	1
Eye	18	4	22	11	33
Ear	14		14	4	18
Nose	28	1	29	3	32
Mouth and pharynx	30		30	30	60
Neck and thorax				1	1
Upper extremity	5		5	4	9
Abdomen (laporotomy)	65	1	66	38	104
Rectum and anus	21		21	9	30
Genito-urinary system	18		18	4	22
Vascular system	3		3	4	7
Lymphatic glands	12		12	1	13
Lower extremity	6		6	4	10
Tumors	4		4	4	8
Gynecological:					
External				76	76
Internal				46	46
Total	224	6	230	240	470

Operations of eye and ear clinic are shown above to complete the table, although it is a separate service. There were 50 deliveries at term in the obstetrical ward with 4 stillbirths and 1 maternal death.

The following is a report of the hospital laboratory work done during the year:

Examinations of—	
Blood	4,969
Urine	3,871
Sputum	2,040
Pathological sections	82
Animal injections	46
Wassermann reactions	4,535

Examinations of—	
Feces	2,823
Smears and cultures	1,885
Water examinations, bacteriological	504
Chemical, biological, and miscellaneous	312

The mean strength of the personnel on duty at this hospital for the year was as follows: Medical officers, 10; dental surgeons, 2 Army Nurse Corps, 23.89.

DEPARTMENT HOSPITAL, HONOLULU, HAWAII.

This is the general hospital for the Hawaiian Department. I serves as a post hospital for the garrisons in the vicinity of Honolulu and receives from Schofield Barracks cases of a serious nature and those requiring special treatment.

During the year the hospital has been more than doubled in size and capacity. Three two-story ward wings, an officers' ward and operatin building, and a barracks for the Hospital Corps detachment have bee completed and opened for use. Two additional buildings, a nurses home and a receiving and clinic building, are under course of construction. The bed capacity may now be considered as 300, whic in emergency can be expanded to 400 or more by the use of the porches The second floor administration building has been converted into a obstetrical and women's ward of 10 beds, with delivery and sterilizin rooms. Work is about to begin to convert one of the main ward into three separate detention wards, one for the care of psychopathic cases, one for prisoners with contagious diseases, and one for prisoners with diseases that are not contagious. An interior telephone system of 30 instruments has been installed. The gas supply has been extended to all wards and departments, and cooking, sterilizing and water heating are now done by gas. Large store rooms have been completed for the storage and issue of all classes of property. Carpenter, plumbing, and paint shops have been built. An enlargement of the kitchen has been made. A hydrotherapeutic clinic has been established. An enlargement of the dining room and a further enlargement of the kitchen will become necessary when the full bed capacity of the hospital is made use of. In the basement of the isolation building a disinfecting chamber and rooms for infected clothing are needed. Refrigerating facilities are inadequate. Plans for a refrigerating and cold storage plant are in preparation. There are no quarters for medical officers at the hospital and but one set of noncommissioned officers' quarters. The acquisition of land is necessary for this purpose and is dependent upon congressional action.

The work in all departments of the hospital has increased during the year, especially in the work of the X ray, the surgical and gynecological service, and the laboratory. During the year 2,283 cases were admitted to hospital, of which number 34 were officers; 4 Army Nurse Corps; 1,965 enlisted men; 268 civilians, and 12 general prisoners. Of these cases 1,126 were medical, 732 surgical, 389 venereal, and 36 mental.

The daily average number of patients in hospital for the year was 111.67.

The following table shows the movement of sick, together with the principal sources of admissions, and the disposition of all cases during the year:

	Officers and enlisted men.	General prisoners.	Civilians.	Total.
Admissions:				
From command	81			81
Transfer	1,845	10	4	1,859
Otherwise	75	2	266	343
Remaining, 1914	75		5	80
Total	2,076	12	275	2,363
Dispositions:				
Returned to duty	1,815	3		1,818
Died	12		8	20
Transferred to other hospitals	166	1		167
Otherwise disposed of	4	8	248	260
Remaining, 1915	79		19	98
Total	2,076	12	275	2,363

The principal causes of admission were as follows:

Gunshot wounds	8	Injuries	277
Diarrhea, gastroenteritis	66	Insanity	36
Malaria	8	Alcoholism	48
Typhoid	2	All others	1,402
Rheumatic affections	47		
Venereal	389	Total	2,283

There were 20 deaths. Of this number 12 were officers and enlisted men and 8 civilians. The following were the causes of deaths:

Typhoid fever	1	Eclampsia	1
Dysentery, bacillary (Hiss-Russell type)	1	Malignant tumor, sarcoma	2
Pneumonia	6	Embolism cerebral (metastatic)	1
Cerebro-spinal meningitis	1	Pulmonary oedema (apoplexy)	1
Heart disease, valvular	1	Cerebral compression (injuries)	3
		Gunshot wounds, head (suicide)	2

There were no discharges during the year.

The mean daily strength of the personnel on duty during the year was as follows:

Officers	9. 60	Hospital Corps	85. 32
Army Nurse Corps	11. 42	Mean aggregate	106. 34

PROVIDENCE HOSPITAL.

The act approved March 3, 1915, having appropriated $19,000 for support and medical treatment of destitute patients in the city of Washington, D. C., under a contract to be made with Providence Hospital by the Surgeon General of the Army, for relief afforded was as follows:

Patients in hospital July 1, 1915	95
Admitted during the year	1,369
Total number treated	1,464
Average number admitted per month	122
Number remaining in hospital June 30, 1916	85
Total number of days' treatment afforded	33,716
Average number of days' treatment per patient	2
Average number of patients treated per day	9
Longest term of treatment (days)	366
Shortest term of treatment (days)	
Number of patients in hospital during the whole year	

LABORATORIES.

A laboratory is provided for each of the departments, the one at the Army Medical School, Washington, D. C., for the use of the Eastern Department; at Fort Leavenworth, Kans., for the Central Department; at the Letterman General Hospital, Presidio of San Francisco, Cal., for the Western Department; at Fort Sam Houston, Tex., for the Southern Department; and at Honolulu, Hawaii, for the Hawaiian Department. The laboratory of the tropical board has become a department laboratory for the Philippine Department, and located at Manila, P. I.

ARMY MEDICAL SCHOOL.

BACTERIOLOGICAL DIVISION.

No changes of importance have been made in the bacteriological laboratories during the past year. The work has been of a varied character, as shown in the following summaries:

TYPHOID FEVER PROPHYLACTIC.

Vaccine prepared in the laboratory was distributed during the six months' periods as follows:

	June 30, 1915.	Dec 31, 1915.	June 30, 1916.
	C. c.	*C. c.*	*C. c.*
rmy	107,823	82,517	340,596
avy	48,528	50,374	84,585
ational Guard	11,709	15,713	33,466
arious Government departments	1,152	2,289	1,148
ivilians and civilian institutions	1,082	761	536
Total	170,294	151,654	460,331

No changes have been made in the preparation of the typhoid vaccine, since our results from that at present in use have been all that ould be desired.

iscellaneous vaccines prepared and distributed to Army posts during the six months' periods.

Summary of clinical laboratory examinations of typhoid fever cases.

	Six months' periods ending—		
	June 30, 1915.	Dec 31, 1915.	June 30, 1916.
Examination of typhoid cases	164	137	184
Convalescents examined:			
Positive	0	1	1
Negative	11	6	4
Suspected carriers or contacts examined:			
Positive	9	5	2
Negative	38	32	64
Widals:			
Positive	12	2	5
Negative	74	55	27
Blood cultures:			
Positive	2	4	1
Negative	22	28	29
Blood cultures from clots:			
Positive	0	0	0
Negative	4	5	2
Examination of feces for b. typhosus:			
Positive	0	0	0
Negative	24	14	60
Examination of urine for b. typhosus:			
Positive	0	0	0
Negative	12	23	5
Examination of feces for b. dysenteria:			
Positive	0	0	
Negative	[illegible]	5	

No chronic bacillus carriers were detected during the fiscal yea ending June 30, 1916.

As there are only a few cases of paratyphoid fever reported yearly it has not seemed necessary, at least in our service, to use a mixed typhoid and paratyphoid vaccine, and none has been used.

Summary of clinical laboratory examinations.

	Six months' period ending—		
	June 30, 1915.	Dec. 31, 1915.	June 30, 1916.

Gonococcus fixation tests	30	37	46

REPORT UPON WASSERMANN TESTS.

The Wassermann reaction has been performed continuously as a diagnostic test for syphilis. During the year ended June 30, 1916, the total number of Wassermann tests in the laboratory was 4,566, of which 1,936 were reexaminations; 1,080 made on Wassermann survey and 1,550 examinations of new cases. Of the latter, 762 were of syphilis or suspected syphilis, and 788 were from cases suffering with diseases other than syphilis. In addition there were 83 tests made for gonococcus fixation, 332 spinal fluids in three dilutions, and 358 titrations of sera previously reported double-plus.

The following table shows the actual results obtained in known syphilitics:

Stage of disease.	Number of cases.	Positive.	Negative.	Per cent positive.
Primary	116	70	46	60.34
Secondary	223	200	23	89.69
Tertiary	285	230	55	80.70
Latent	138	81	57	58.69
Total	762	581	181	76.25

CHEMICAL LABORATORY.

The following analyses and examinations were made:

Drugs	3	Woman's milk	1
Feces	12	Stomach contents	18
Intestinal contents	3	Water	77
Cow's milk	37	Urine	9

X RAY LABORATORY.

In this laboratory the work done in addition to instruction is represented by the following table:

X ray:	
Radiographs	7,121
Dental films	2,001
Photomicrographs	45
Photographic:	
Negatives	665
Prints	2,756
Photographic—Continued.	
Lantern slides	720
Moving-picture film developed ...feet	600
Kodachromes	70

Letterman General Hospital.

Capt. Henry J. Nichols, Medical Corps, has been in charge of the laboratories for chemical and pathological work the greater part of the year, having assumed charge January 15, 1915, when an independent laboratory service was inaugurated. Capt. C. G. Snow, a valuable assistant, was transferred to the laboratory at Fort Bayard April 14, 1915. Sergt. Kincaid, who had been in the laboratory for seven years, was on February 11, 1915, relieved by Sergt. Higgins, who was replaced on August 5 by Sergt. Augsburg. The present force consists of one sergeant and 6 privates first class, and privates.

An addition to the laboratory has been authorized at a cost of about $5,000 and has recently been occupied. This building, with some additional equipment, has made it possible to devote certain rooms to certain kinds of work, and it is believed that the increased efficiency thus gained will justify the expenditure. The old laboratory, consisting of two large rooms, was badly overcrowded. With the installation of gas, the laboratory will be thoroughly equipped for regular and special work.

The laboratories served as clinical laboratories for the hospital with its 3,195 admissions and as a department laboratory for the western department. The work covers parts of chemistry, bacteriology, parasitology, pathology, and serology and may be summarized as follows:

Urine examinations	4,288	Wassermann reactions	3,148
Sputum examinations for tubercle bacilli	1,554	Skin reactions	387
Blood examinations	638	Throat cultures for diphtheria	1,196
Examination of venereal sores and discharges	313	Examinations of feces for parasites and ova	414
Cultures, miscellaneous	103	Smears, miscellaneous	75
Vaccinations and injections	361	Vaccines made	60
Functional tests (urine)	13	Animal inoculations	103
Water examinations:		Typhoid examinations:	
Chemical	13	Blood	32
Bacteriological	85	Stool	10
Milk examinations:		Urine	6
Chemical	13	Agglutinations	13
Bacteriological	13	Stomach contents, routine	30
String tests and occult blood tests	26	Stomach contents, toxicological	2
Chemical examinations, flour, lemonade, candy, bread, tablet	5	Miscellaneous	20

Autopsies.—Under orders of the commanding officer, post-mortem examinations were made on all officers and enlisted men dying in the hospital, and permission was obtained for examination of most of other cases. Of the 73 deaths, 58, or about 80 per cent, have been followed by autopsies.

A parallel list of clinical and pathological diagnoses has been kept and the following lesions not clinically diagnosed have been found Glioma of brain, hemorrhagic pachymeningitis, softening of the brain (2), tubercular abscess of apex of lung (2), one with extension into spinal canal and producing a transverse myelitis by pressure empyema, pleural effusion (5), miliary tuberculosis, diaphragmatic hernia, pericarditis (5), atrophic cirrhosis of liver (2), gumma of pancreas, cancer of stomach, general peritonitis (5), appendicitis, cancer of prostate.

In general, about 75 per cent of clinical diagnoses were confirmed at autopsy.

Syphilis.—On October 5, 1915, a survey of most of the wards was made for the presence of syphilis, and of 215 patients, 47, or 21.9 per cent, were found to have syphilis; 12 per cent were in hospital for recognized syphilitic lesions and in 5.5 per cent syphilis was coincident, while in 3.5 per cent it had not been diagnosed and was found by Wassermann reaction.

Capt. Snow had developed a delicate technique for the Wassermann reaction, using different amounts of serum and a carefully controlled hemolytic system of goat cells. This system was used until Capt. Snow left for Fort Bayard, and then in the interest of uniformity with the other service laboratories the method devised by Capt. Craig at the Army Medical School was adopted and has been satisfactory. The use of the cholesterinized antigen has proved to be superior to the ordinary antigen in known cases, such as in primary cases and in cases of aneurysm, tabes, and paresis, and false positives have not been proved to occur. Spinal fluid examination has proved of great value in the diagnosis and prognosis of syphilitic conditions. Routine examinations have been made of all mental cases and should be made in all cases of syphilis before treatment is suspended. Twenty examinations have been made in the primary and secondary stages. No instance of involvement of the nervous system has been found in 6 primary cases, 5 early secondary cases showed no abnormalities, 6 showed slight changes, and 3 definite changes.

Eighteen intraspinal injections of salvarsanized serum have been given in 9 cases. Two cases of tabes have shown definite improvement, but none was seen in cases of paresis. Mercurialized serum was injected 13 times in 4 cases. These injections had some effect on the spinal fluid findings, but apparently less than salvarsanized serum. The intraspinal method is believed to be a rational and effective local treatment of syphilis of the nervous system. In the military service its use is apt to be limited, because while many patients can be improved they can not be returned to full duty, and are therefore discharged for disability. In selected cases, however, its use is indicated.

Under War Department orders requiring a Wassermann reaction on all accepted recruits, 1,106 specimens have been sent to this laboratory from Fort McDowell since July 23. The results of examination are as follows:

	××	×	×−	−	Total.	××
						Per cent.
Recruits	44	16	28	643	731	6.0
Reenlisted men	53	5	19	298	375	14.1
Total	97	21	47	941	1,106	
Per cent	8.7	1.8	4.2	85.0		

It will be seen that in this set of examinations reenlisted men show more than twice as many cases of infections as recruits.

Capt. De Voe has checked up the (× ×) cases clinically and has found a history of initial lesion or other evidence of probable infection in about 50 per cent of the positive cases.

Typhoid group.—No case of typhoid fever has occurred during the year. One case of paratyphoid A was diagnosed by blood culture, in a soldier who had antityphoid vaccination two years before.

The typhoid case record for the hospital for the last five years is as follows: 1911, 19; 1912, 2; 1913, 1; 1914, none; 1915, none. These results are undoubtedly due to compulsory antityphoid vaccination. Some writers on the subject have claimed that the freedom of the Army from typhoid was only apparent and that mild and atypical cases occurred which were not recognized. With this criticism in mind, blood cultures have been made on all cases of continued fever and at autopsies the condition of the ileum and gall bladder has been carefully examined, but no cases have been detected. The conclusion is that typhoid fever has not been present in the 3,195 persons admitted.

The descriptive lists of all military patients have been examined for record of antityphoid vaccination and 25 have been found apparently incomplete. On further examination 11 have been found to be really incomplete, and in 5 cases the necessary injections were given; in the other cases the patients were discharged for disability.

Diphtheria.—Diphtheria occurs annually during the winter months in San Francisco and usually spreads to the nearby garrisons. In December a few cases occurred in Company G, Twenty-fourth Infantry, and scattering cases elsewhere in the Presidio. Company G was isolated and examined; 5 cases and 25 carriers were found, or 19 per cent of carriers. This figure has been maintained for the other contacts examined.

The Schick test has been made on 12 nurses, and 4 were found immune. One untested nurse in charge of diphtheria patients became infected. Thirty-seven medical officers and Hospital Corps men were tested and 17 found immune. A number of tests have been made on cases and contacts and carriers in children and adults and the same general results have been obtained as have been reported in the literature of this subject. From the military point of view the test seems to be of value in detecting those who are naturally immune before an epidemic appears. A list of immunes can be kept among doctors, nurses, and corps men, and details for care of patients can be made from this list. The drawbacks to the test are, the difficulty o securing good toxin at remote places, the poor keeping qualities o the toxin, the difficulty of reading partial reactions, and the necessity of observation for several days before a final reading is made. In the presence of an epidemic these are disturbing factors, but during intervals they could be obviated.

Amœbic dysentery.—This disease presents a distinct problem in treatment at this hospital because nearly 50 cases have been admitted and there is no concensus of opinion as to the best treatment. Emetine is of great value, clinically, but practically 100 per cent of case relapse under emetine alone. With the cooperation of the medica service, patients in one ward have been treated with emetine an ipecac by mouth, in another ward a series has been started on emetin and bismuth with quinine irrigations. None of the first set are fre from amœba, but several of the second series have been free for several months.

Two cases of bacillary dysentery were admitted from a transport. A dysentery bacillus was isolated from the stool, but has not yet been fully identified.

Amount of work and needs.—The work done exceeds that of the previous year by about 33 per cent. An analysis shows that over 80 per cent of the examinations gave negative results, and this emphasizes the large amount of work that must be done in a laboratory in order to arrive at the small percentage of positive results. Nearly all advances in clinical medicine have a laboratory element, and the demands on the laboratory are constant and increasing. This point is made in order to state that the number of men required for the proper laboratory work of this hospital will increase, and that if any amount of special work is to be done—and it should be done—another medical officer should be detailed.

At present, in equipment, the greatest need is gas, without which makeshifts will continue to be necessary.

In personnel there is a distinct need for men with some training in chemical and clinical laboratory work, and it seems that the Army Medical School might serve as a school for enlisted men as well as for officers along the line of the other service schools. At present the finding of trained men, or of men capable of training, is more or less a matter of chance.

Special work.—Ten specimens from autopsies have been sent to the Army Medical Museum and four specimens and cultures have been sent to the Army Medical School.

One lecture on syphilis was given at the Stanford Medical School, two papers on antityphoid vaccination and two on tropical medicine have been read at medical meetings. Three of these papers have been published.

Some work on gall-bladder infections in the rabbit with typhoid, paratyphoid, and dysentery bacilli, as bearing on the carrier problem, is under way, thanks to a special appropriation from the Surgeon General's Office, for animals.

Seventeen cases have been examined for the presence or cure of syphilis by the Wassermann provocative Wassermann, luetin and spinal fluid tests. All tests were negative in 7 cases and one or more tests were positive in 10 cases.

FORT SAM HOUSTON, TEX.

The department laboratory has served practically one-half of the mobile army during the whole period and complied with requests for almost 13,000 laboratory examinations and operations and filled 398 requisitions for supplies of various kinds.

A summary of these activities follows.

Miscellaneous vaccine prepared and distributed during the year 1915.

VACCINES.

The great variety of infections usually met with in military practice have been extensively treated by suitable vaccines and the prompt and favorable results obtained fully justify the following conclusions:

The use of properly selected vaccines—

1. Markedly reduced the intensity and period of suffering on the part of the patient; and

2. Reduces to a minimum (*a*) time lost from duty, (*b*) period of hospital care and treatment, (*c*) the direct expenditure for medicines and dressings.

Summary of clinical laboratory examinations of typhoid and paratyphoid fever cases.

Cases examined for typhoid fever	36
Widals:	
Positive (2 soldiers and 1 civilian)	3
Negative	0
Blood cultures:	
Positive	[1] 4
Negative	25

TYPHOID AND PARATYPHOID FEVERS.

Typhoid fever appeared for the first time since the concentratio of troops (amounting to 45 per cent of the mobile army of the Unite States) in the Southern Department, in the persons of two soldier belonging to organizations attached to small units. In one case n previous history was obtained but in the other the soldier passe most of his time in the home of a civilian living adjacent to the camp. A member of this family was ill and this laboratory found *B. typhosus* in specimens submitted from this patient prior to the receipt of specimens from the soldier. The etiological organism was isolated from blood cultures and feces in the three cases (one civilian), the urine in one case, and positive widals were obtained in the three cases.

---

[1] Two cultures from one case.

A comparison of the incidence of typhoid fever in large, semipermanent camps similar to those of 1898 as made below confirms the fact that since the introduction of typhoid prophylaxis in the Army the typhoid rate in such camps has progressively diminished, a fact that is not affected by the two cases here reported, these having occurred in small, isolated and widely separated units.

	Cases of typhoid.		Deaths.	
	Certain.	Certain and probable.	Typhoid.	All causes.
898—Camp at Jacksonville, Fla. (troops, 10,759)	1,729	2,693	248	281
911—Camp at San Antonio, Tex. (troops, 12,801)	1			11
eb. 26, 1913, to Aug. 31, 1915—Camp at Texas City and Galveston, Tex. (troops, 11,500)				(1)

[1] No report.

B. paratyphosus B was isolated from the purulent exudate from he glands of a soldier suffering from a multiple lymph-adenitis, which was clinically diagnosed as Hodgkin's disease. The soldier gave no history of previous illness resembling typhoid fever, and the ondition for which he appeared on sick report was not one of the equelæ of such infection.

Clinical laboratory examinations of Mediterranean fever cases.

umber of cases examined for Mediterranean fever	34
Positive	17
Negative	17

MEDITERRANEAN (MALTA) FEVER.

The presence of Mediterranean fever in the Southern Department s worthy of serious attention. Out of 34 examinations made for his disease 50 per cent were found positive, 16 being cases of civilians onnected with the goat-raising industry, and the other one an Army fficer who gave a history of having eaten "barbecued" goat meat ut denied having used goat's milk in any form or having served in e vicinity of goat herds. One of the cases of civilians proved fatal.

MILK EXAMINATION.

The method of making milk examinations that has been in use i this laboratory for the past three months has been found satisfac tory, and monthly submission of sample from the dairies supplyir Fort Sam Houston, Tex., Fort Bliss, Tex., and Camp Douglas, Ariz has been directed by the commanding general of the departmen

This method furnishes information as to (*a*) bacterial conten (*b*) leucocyte count, (*c*) presence of certain known disease-producin bacteria, (*d*) the presence of some preservatives, (*e*) the percentag of fat, and (*f*) the specific gravity and presence or absence of adde water.

These results can be determined from a sample of milk small enough to be easily shipped by mail after preparation by the post surgeons and furnish them with accurate data upon which report can be made as to the quality of the milk supply as required by A. R. 1387.

Supplies furnished to posts in the Southern Department, in addition to those furnished the base hospital, Fort Sam Houston, Tex.

Secured on requisition:

---

[1] Classification made on clinical data accompanying requests for the tests.

Particular attention is paid to the Wassermann test, and it is believed that the results are satisfactory.

CLINOSTOMUM MARGINATUM.

Specimens of this fluke were found in fresh-water bass caught at Medina Dam in the vicinity of San Antonio, Tex.

This is mainly interesting because of its economic importance an the fact that hitherto it has not been reported as existing so far south the previously known distribution being from Kansas City and St Paul on the west to Montreal on the east, and St. Paul on the nort to Philadelphia on the south. This parasite is not known to be injurious to the human system, but does render the edible portion o food and game fishes unfit for consumption.

Honolulu, Hawaii.

The department laboratory, Hawaiian Department, was establishe in June, 1914. It is a part of the department hospital and takes car of all routine laboratory work of the hospital and Fort Shafter, a well as the more specialized work for other posts in the department The work is at present done in one small room in the administratio building. Examinations of urine and feces and the preparation o vaccines are carried on side by side, which constitutes a conditio far from ideal. These conditions must be tolerated pending th completion of the new clinic building, which will contain for th laboratory a large room extending entirely across one floor, with smaller room for the office and records.

The equipment added recently includes a large electric centrifug new incubator, and dark-field substage with arc lamp. The last ha proven invaluable for the quick, easy diagnosis of chancres an mucous patches. Additional equipment will be added when there a place to put it.

The personnel in charge of this work consisted of Capt. Frederic H. Foucar and two privates, which can not make for a further increas in the volume of work put out. It is contemplated, with addition quarters, to add a noncommissioned officer to the personnel, to ca for the records and handle a great deal of the routine work.

Summary of clinical laboratory examinations.

Urines	2,877	Blood cultures	20
Blood counts	619	Animal inoculations	9

Wassermanns	2,967	Spinal fluid (butyric acid)	18
Water bacterial	67	Serum agglutinations	115
Chemical examinations, water	25		
Tissue sectioning	27	Total	8,815

The officer in charge furnishes the following as the most interesting data to be observed on looking over the above table:

Two outbreaks of diphtheria—June, 1914, and November and December, 1915.

An outbreak of dysentery (bacillary) occurred in September-October, 1915—about 40 cases among soldiers; 2 fatal cases (both children.) Organism isolated was of the Hiss-Russell type; a vaccine prepared, and 50 children of Fort Shafter were inoculated (3 doses); there were no additional cases among the children isolated.

A Wassermann survey was started on the Twenty-fifth Infantry at Schofield Barracks, but was discontinued after 500 specimens had been turned in; 8¼ per cent were double plus; it has been found very valuable to have record of these positive Wassermanns, for in several instances it has materially hastened arriving at a diagnosis in these men when subsequently admitted to the department hospital for treatment. It would be ideal if such a Wassermann record—containing, as it does, history of all venereal infection—could be had, kept up to date, from time to time for all men of the command.

The technique of the Wassermann is identical with that of the Army Medical School, with the exception that a liquid amboceptor is employed, for it is thought hat it keeps better in this climate, is quicker and more accurate in titrating. By means of the dark field, in the past 12 months 40 primary lesions have been diagnosed—many before onset of a positive Wassermann.

In routine examination of urine the frequency of a dietetic glycosuria is noted.

Examination of stools revealed numbers of cases of amoebic dysentery and hookworm—all these cases contracted in States, though these conditions do exist among he natives. The cases of malaria were all in men newly arrived from the States and iving definite history of previous attacks.

An outbreak of typhoid fever at Schofield Barracks starting in November, 1915—irst case that of a Japanese servant—four cases (with positive blood cultures) among oldiers; several other cases occurring among servants and children.

Two sharp outbreaks of food poisoning, both involving almost an entire company. First at Schofield Barracks, and due to absorption of toxins produced in meat by the B. *paratyphoid* B; abrupt onset, short course and lack of agglutination on part of atients ruling out diagnosis of paratyphoid fever. Second, a company at Shafter, ue to eating a mess containing poisonous fish.

MEDICAL DEPARTMENT.

The following statement shows the strength of the personnel commissioned, enlisted, and employed by contract or otherwise, of the Medical Department on June 30, 1916:

Medical officers	443
Medical reserve officers, active duty	146
Contract surgeons	17
Dental surgeons, commissioned	40
Acting dental surgeons, under contract	35
Army Nurse Corps	150
Medical Department enlisted personnel	4,670
Civil employees	291
Total medical personnel	5,792

MEDICAL CORPS.

The Medical Corps is composed of the commissioned medical officers of the Regular Army:

Authorized strength June 30, 1916	444
In service June 30, 1915	433
Appointed during the year	14
Total	447
Losses during the year	4
In service June 30, 1916	443

On October 1, 1915, 20 candidates who had passed the preliminary examination for appointment in the Medical Corps reported a Washington to take the course of instruction at the Army Medica School. Seventeen successfully completed the course of instructio at the school and were graduated June 1, 1916. Fourteen graduate were recommended for appointment in the Medical Corps of th Army.

Losses during the fiscal year.

	Colonel.	Captain.	First lieutenant.	Total.
Died	1	1		
Retired	1			
Resigned			1	
Aggregate	2	1	1	

The following promotions were made: 2 lieutenant colonels to b colonels; 2 majors to be lieutenant colonels; 2 captains to be major 22 lieutenants to be captains.

The department held two preliminary examinations for appoin ment in the corps, the first on July 12, 1915, and the second o January 10, 1916, at various Army posts throughout the countr Nineteen applicants passed the preliminary examinations. Of th number 12 attended the session of the Army Medical School, whic ended June 1, 1916, leaving 7 who will attend the next session of the school. Preliminary examinations will be held on July 17, 1916, August 14, 1916, and September 5, 1916, at various Army posts throughout the United States, Panama, and Porto Rico, to which over 200 candidates have been invited.

MEDICAL RESERVE CORPS.

On roster June 30, 1915		1,426
Appointed during the year		542
		1,968
Losses during the year:		
Resigned	34	
Discharged	6	
Died	11	
Commissions vacated by appointment to regular corps	14	
		65
On roster June 30, 1916		1,903

Of the 1,903 on roster June 30, 1916, 146 were on active duty and 1,757 on the inactive list.

On active list June 30, 1915		86
Ordered to active duty during the year		136
		222
Relieved from active duty	62	
Commissions vacated	14	
		76
On active duty June 30, 1916		146

An officer of the Medical Reserve Corps residing in the vicinity of each military post has been designated as a locum tenens, and the policy has been adopted of calling such officer into actual service for duty at his post when all the regular medical officers thereat are called upon to accompany troops into the field.

CONTRACT SURGEONS.

n service June 30, 1915	14
ontracts made during the year	11
Total	25
ontracts annulled during the year	8
Contracts in force June 30, 1916	17

These contract surgeons are on duty at arsenals, remount depots, transports, etc., at the rate of pay ranging from $75 to $150 per month.

DENTAL CORPS.

ental surgeons:		
Number of dental surgeons in service June 30, 1915	34	
Appointed during the year	7	
	41	
Resigned during the year	1	
On duty June 30, 1916		40
cting dental surgeons:		
Number of acting dental surgeons in service June 30, 1915	35	
Appointed during the year	15	
	50	

Acting dental surgeons—Continued.		
Contracts annulled	8	
	42	
Contracts annulled by acceptance of commission as first lieutenant, dental surgeon	7	
On duty June 30, 1916		35
Total		75

One examination of applicants for appointment as acting dental surgeon, United States Army, was held during the year, on October 18, 1915. At this examination 10 were successful; the 10, with 5 who had passed a previous examination, were given contracts.

Under the act of March 3, 1911, acting dental surgeons who have served three years in a satisfactory manner become eligible for appointment as dental surgeons and after passing the prescribed examination are eligible for commission in the Dental Corps with the rank of first lieutenant, provided the total number of dental surgeons of that rank did not exceed 60.

During the year 10 acting dental surgeons, having served 3 years, became eligible for such promotion; of these, 7 passed the required examination and have been promoted.

ENLISTED FORCE OF THE MEDICAL DEPARTMENT.

Strength at date of last report, June 30, 1915:	
Sergeants first class	29
Sergeants	40
Corporals	4
Acting cooks	18
Privates first class and privates	3, 05
Total	3, 99
Gain, July 1, 1915, to June 30, 1916:	
By enlistment	58
By transfer from line, including unassigned recruits from depots	1, 41
By return from desertion	15
General prisoners restored to duty	
Total	2, 16
Loss during same period:	
By discharge—	
Expiration of term of service	27
By order	39
Certificate of disability	4
Sentence general court-martial	1
Transfer to reserve	2
Transfer to line	1
By retirement	
By death—	
Due to disease	
Drowned	
Suicide	
By desertion	2
Dropped	
Total	1, 4
Leaving in service June 30, 1916:	
Sergeants first class	3
Sergeants	5
Corporals	
Cooks	1
Privates first class and privates	3, 5
Total	4, 6

The enlisted personnel of the Medical Department was also reorganized. The designation Hospital Corps was changed to Medical Department (enlisted force). Two new grades above sergeant, first class, were established: Master hospital sergeant, with pay of $75 per month, and hospital sergeant, with pay of $65 per month. The pay of sergeants was made to compare to that of the similar grade in other staff corps, $36 per month.

The percentage basis was adopted for the Medical Department, 5 per cent of the enlisted strength of the Army being allowed; in time of actual or threatened hostilities the Secretary of War is authorized to cause to be enlisted such additional number of men as the needs of the service may require.

Following are the grades as now established: Master hospital sergeants, hospital sergeants, sergeants first class, sergeants, corporals, cooks, horseshoers, saddlers, farriers, mechanics, privates first class, privates.

Ratio of privates first class to privates is now the same as in the Quartermaster Corps.

Ratings for additional pay for privates first class were established as follows: Dispensary assistant, $2 a month; nurse, $3 a month; surgical assistant, $5 a month.

ARMY NURSE CORPS.

The authorized strength for the Army Nurse Corps for the fiscal year ending June 30, 1916, has been 150, which, however, has been far from sufficient to supply the demand for nurses. Two nurses from the eligible list have been employed under contract since April 28, at the Walter Reed General Hospital, Takoma Park, D. C., owing to the increased work at this station. The appointment of 12 additional nurses was authorized on June 9 by the Secretary of War, and in consequence 12 nurses were assigned to duty at the base hospital, Fort Bliss, Tex. Eight more have been ordered to the base hospital, Fort Sam Houston, Tex. Additional nurses will be sent to both these hospitals as soon as provision is made for an ncrease in the Nurse Corps. Four nurses who have been on duty at Fort Leavenworth have been transferred from there, on account of the transfer of the troops to the Mexican border.

New quarters for nurses have been furnished and are occupied at the department hospital, Honolulu, and the quarters at Letterman General Hospital will be ready for occupancy in August. Plans are being drawn also for nurses' quarters at Fort Sam Houston, the nurses in the meantime occupying rented quarters at the post as a emporary arrangement.

Seven hundred and fifty requests for application blanks have been eceived during the year. During the same period there have been 34 discharges and 1 death; 40 appointments and 7 reappointments; otal, 47.

The appropriation bill for the coming fiscal year now before Congress provides for 56 additional nurses, but on account of the recent mobilization on the Texan border of the militia, in addition to the egular troops, a further increase will be required.

ARMY MEDICAL SCHOOL.

Col. William H. Arthur, Medical Corps, relieved Col. Charles Richard, Medical Corps, on September 30, 1915, as commandant of the school and professor of military surgery.

Maj. Eugene R. Whitmore, Medical Corps, assumed the duties of professor of military medicine and tropical medicine on August 4, 1915, relieving Lieut. Col. Champe C. McCulloch, jr., Medical Corps. In taking up this duty Maj. Whitmore did not relinquish his professorship in bacteriology, pathology, and laboratory diagnosis.

Capt. Ralph H. Goldthwaite, Medical Corps, relieved Capt. Edward M. Talbott, Medical Corps, as assistant professor of ophthalmology on November 3, 1915.

Capt. Paul L. Freeman, Medical Corps, reported on January 26, 1916, for a special course of instruction, relieving Capt. Thomas D. Woodson, Medical Corps.

The twentieth session of the school began on October 1, 1915, and ended May 20, 1916.

The number of accepted candidates appointed in the Medical Reserve Corps and ordered to the school was 20. Of this number, one failed to report, one resigned after reporting and before commencing the course, and one was later relieved from attendance by reason of physical disability.

Two members of the Medical Corps of the Organized Militia, one from the Georgia National Guard and one from the Pennsylvania National Guard, were admitted to the school. Both of these officers finished the course for medical officers of the Organized Militia and were found proficient. Certificates of proficiency were issued to them

The post-graduate course for officers of the Medical Corps was inaugurated and six officers (Capts. Charles L. Foster, Joseph F Siler, Craig R. Snyder, Lucius L. Hopwood, Lee R. Dunbar, and William S. Shields) were ordered to and reported at the school. This course was very successful and of great advantage to the officers taking it, though it was curtailed by the exigencies of the service.

Of the 17 student candidates under instruction at the school, 16 qualified at the final examination. Of this number 15 were recommended for commission in the Medical Corps, one failing to receive such recommendation because of deficiency in aptitude for the military service.

The following table exhibits the course of instruction, the names of the professors and assistant professors, the value given to each subject, and the hours of instruction:

No.	Subject.	Hours of instruction.	Professor.	Value.	
				Maximum.	Minimum.
1	Military surgery	26	Col. Wm. A. Arthur	800	640
2	Medical Department administration	26	Lieut. Col. J. D. Glennan	800	640
3	Military medicine and tropical medicine.	36½	Lieut. Col. C. C. McCulloch and Maj. E. R. Whitmore.	800	640
4	Ophthalmology	76½	Maj. T. C. Lyster, professor, and Capt. R. H. Goldthwaite, assistant professor.	400	320
5	Military hygiene	22	Maj. W. J. L. Lyster	800	640
6	Bacteriology, pathology, and laboratory diagnosis.	276	Maj. E. R. Whitmore, professor; Capt. Edw. B. Vedder and M. A. Reasoner, assistants.	900	720
7	Sanitary chemistry	159	Maj. R. B. Miller	600	400
8	Sanitary tactics	76	Capt. P. L. Jones	500	400
9	Operative surgery	8	Capt. Arthur C. Christie	400	320
10	Roentgenology	19	do	300	240

In addition to the above the following instruction was given: Series of lectures on psychiatry, general paralysis of the insane, mental defectives, psychosis occurring in mental defectives, dementia precox, hebephrenic type, paranoia; manic-depressive psychosis; psychoanalytical methods; hysteria and psycho-neuroses, by First Lieut. William A. White, M. R. C., superintendent of the Government Hospital for the Insane, special professor. In addition to these lectures there were clinical demonstrations by Capts. Thomas D. Woodson and Paul L. Freeman, Medical Corps, as follows: Dementia precox, general paralysis of the insane, manic-depressive psychosis, paranoid state, paranoid dementia precox, involutional melancholia, senile dementia, paresis, progressive muscular atrophy, paranoia, malingering in old dementia precox, juvenile paresis, and mental defectives. Twenty-four hours were devoted to the general subject.

Thirty hours instruction in equitation by First Lieuts. Sloan Doak and David H. Scott, Fifth United States Cavalry.

Twelve lectures on military law by Maj. Walter A. Bethel, Judge Advocate General's Department.

No special professors were designated during the 1915–16 session.

Two sergeants, Hospital Corps, were detailed at the school for nstruction in X-ray work and photography; they both proved to be apt, and acquired the technical knowledge and skill necessary to qualify them as instructors in these subjects, and were given certificates of proficiency.

The closing exercises were of an informal character. The diplomas were presented to the graduates by the Surgeon General of the Army with a few appropriate remarks. The two medals—the Hoff memorial medal and the Sternberg medal—which were awarded to First Lieuts. Edward A. Noyes and Paul A. Schule, respectively, were not presented during the exercises, there not being sufficient time between the final examinations and the date of graduation in which to have them properly engraved.

All the officers assigned to duty at the school have performed their various duties in a most satisfactory manner.

The enlisted personnel has also shown itself to be satisfactory in every respect. There has been no infraction of discipline among the men of the detachment.

The commandant, in closing his report, remarks that—

> The clerical force has performed its duties efficiently and satisfactorily.
>
> In view of the fact that the request for an appropriation for the building of an Army Medical School has been disapproved, and that the present building is too small for the enlarged classes that may be expected in the future, and generally very poorly adapted to the needs of the school, it has been recommended that another building be occupied for the purpose, and one has been selected at No. 604 Louisiana Avenue, which, while it increases the expenses very little, will give more than twice the space of the present building.
>
> It seems to me that too much time is given up to laboratory work in the school and not enough attention paid to sanitary tactics. I therefore recommend that in the future the students be required to spend at least two weeks in camp. A camp could be established on the grounds of the Walter Reed General Hospital, and two, or preferably three, well qualified medical officers selected to give the students some field training. While the laboratory work is very important, it is not strictly military, and the students have no opportunity of learning to care for themselves in camp, the details of camp sanitation, and the general duties of medical officers in the field.
>
> If it is practicable, it is considered that the post-graduate course for medical officers be repeated during the next session of the school for at least six officers of the corps if they can be spared for the purpose. Some of these officers might incidentally be utilized as instructors in the students' camp, if my recommendation for its institution is carried out and the necessary equipment for such a camp can be supplied from the Quartermaster Corps.

SPECIAL WORK BY MEDICAL OFFICERS.

BULLETINS.

In the sundry civil bill for 1916, under the appropriation for printng and binding for the War Department, it was provided:

> That the sum of $3,000, or so much thereof as may be necessary, may be used for he publication from time to time of bulletins under the direction of the Surgeon eneral of the Army for the instruction of medical officers when approved by the ecretary of War.

Under the authority mentioned above, two bulletins were issued uring the year, viz:

BULLETIN No. 9. Gunshot roentgenograms, a collection of roentgenograms taken in onstantinople during the Turko-Balkan War, 1912–13, illustrating some gunshot ounds in the Turkish Army, by Maj. Clyde S. Ford, Medical Corps.

BULLETIN No. 10. Officers of the Medical Reserve Corps, United States Army, nactive list, with post-office addresses of each, compiled under the direction of the urgeon General.

Material is now on hand for three bulletins, which will probably e issued some time during the fiscal year 1917.

ARTICLES BY MEDICAL OFFICERS.

NOTE.—It is desired to include in this list all articles written by medical officers uring the fiscal year. It is therefore requested that the title and place of publicaion of articles written by medical officers be sent to the office of the Surgeon General.

Articles by medical officers of the Army, July 1, 1915, to June 30, 1916.

Author.	Article.	Disposition.
rthur, Col. William H.	Postgraduate instruction at the Army Medical School.	Military Surgeon, February, 1916.
shford, Maj. Bailey K.	The dietetic treatment of sprue	Read by title before American Society of Tropical Medicine, San Francisco, Cal., July 14-16, 1915. American Journal of Tropical Diseases and Preventive Medicine, January, 1916.
Do	Surgery related to odontology	Revista Dental, Habana, Cuba, December, 1915.
Do	Further experimentation in animals with a monilia commonly found in sprue.	American Journal of Medical Sciences, April, 1916.
Do	Tropical diseases	Chapter for fourth volume of Musser and Kelly's Practical Treatment, 1916.
shford, Capt. Mahlon	A proposed motor-ambulance company.	Military Surgeon, October, 1916.
Do	The American doctor and military preparedness.	Awaiting publication.
arber, Capt. John R.	Sanitary problems of prison and concentration camps.	Read before Southwest Medical and Surgical Association, El Paso, Tex., Dec. 9-11, 1915; awaiting publication.
irmingham, Col. Henry P.	Coordination of the Medical Departments of the Army and Navy in campaign.	Military Surgeon, April, 1916.
ispham, Maj. William N.	A review of the sanitary service in the present war.	Awaiting publication.
amberlain, Maj. Weston P.	Demography in so far as it relates to the vital statistics of armies.	Do.
ristie, Capt. Arthur C.	A motor ambulance for field service.	Do.

Articles by medical officers of the Army, July 1, 1915, to June 30, 1916—Continued.

Author.	Article.	Disposition.
Cole, Capt. Clarence L	Report of a case of infection of lymph glands with Bacillus Paratyphosus B.	Journal of Infectious Diseases, April, 1916.
Connor, Capt. Clarence H	The special physical examination of aviators for the United States Army.	Awaiting publication.
Cooper, Capt. Alexander T	The Wassermann reaction and its relation to tuberculosis. (Collaborated with Capt. C. G. Snow.)	American Journal of the Medical Sciences, August, 1916.
Coulter, Capt. John S	Study of pathology of gall bladder and biliary passages in cholera.	Philippine Journal of Science, Manila, November, 1915.
Craig, Capt. Charles F	Observations upon complement fixation in the diagnosis of pulmonary tuberculosis.	Journal of Medical Sciences, December, 1915.
Do	Observations upon the endamœbæ of the mouth: I. Endamœbæ gilgivalis (buccalis).	Journal of Infectious Diseases, February, 1916.
Do	Importance of tropical diseases to American practitioner, as illustrated by their occurrence in the United States.	American Journal of Tropical Diseases and Preventive Medicine, July, 1915.
Do	Some practical points regarding the results and interpretation of the Wassermann test for syphilis.	Military Surgeon, March, 1916.
Culler, Capt. Robert M	An intermediate method of blood transfusion.	Awaiting publication.
Darby, Capt. Taylor E	Hygiene for the Boy Scouts	Pamphlet prepared for publication as a handbook for the Boy Scouts of America.
Davis, First Lieut. Henry L., Medical Reserve Corps.	A case of poisoning by methyl alcohol, fluid extract hamamelis, and a hair tonic, with recovery.	Awaiting publication.
De Laney, Maj. Matthew	Epidemic of bacillary dysentery due to Hiss-Russell bacillus.	Military Surgeon, May, 1916.
Duncan, Capt. Louis C	Some experiences of the territorial armies of France, 1870–71 (translation from the French).	Journal of Military Service Institution.
Do	The sanitary service (translation from the French Journal L'Illustration).	Military Surgeon, January, 1916.
Ebert, Col. Rudolph G	Some Medical Department problems of over-seas garrisons.	Military Surgeon, August, 1916.
Edger, Maj. Benjamin J., jr.	Some cases of appendicitis at Schofield Barracks, Hawaii.	Read before United Service Medical Society of Hawaii, Dec. 4, 1915; awaiting publication.
Ferenbaugh, Capt. Thos. L	A note concerning the occurrence of hydrophobia in the foxes of Alaska.	Military Surgeon, June, 1916.
Fisher, Lieut. Col. Henry C.	Preparedness of the Medical Department for war.	Military Surgeon, February, 1916.
Foster, Capt. George B., jr	Etiology of common colds	Journal of American Medical Association. Apr. 15, 1916.
Foucar, Capt. Frederick H	Bacillary dysentery, recent epidemic at Fort Shafter, Hawaii, from the laboratory aspect.	Military Surgeon, May, 1916.
Frick, Lieut. Col. Euclid B	Venereal disease in the Army	Read before Ninth Internationa Purity Congress, San Francisco Cal., July 22, 1915.
Gorgas, Maj. Gen. W. C., Surgeon General.	Tropical sanitation in its relation to general sanitation.	Address delivered before fifteent annual conference of health officer of New York State, at Rochester Sept. 6, 1915; Journal of America Medical Association, Dec. 25, 1915
Do	The relation that modern tropical sanitation will probably have on the future movements of populations.	Address delivered before Souther Commercial Congress at Charlesto S. C., Dec. 16, 1915.
Do	Report on the sanitation of Guayaquil.	The Southern Medical Journal, N vember, 1915.
Do	Dr. Carlos G. Finlay	Address delivered at forty-thir annual meeting of American Publ Health Association, Rocheste N. Y., Sept. 7, 1915.
Do	The effect that the sanitary work accomplished in Cuba and in Panama has had and will have upon the sanitation of the Tropics.	Address delivered before Vermo State Medical Society, Burlingto Oct. 14, 1915; Southern Medic Journal, February, 1916.
Do	Yellow fever	Commemoration volume of t American Medical Associatio 1915.
Hess, Maj. Louis T	Paper on recruiting	Awaiting publication.
Do	Deficiency of sanitary units of the Organized Militia.	Military Surgeon, April, 1916.

Articles by medical officers of the Army, July 1, 1915, to June 30, 1916—Continued.

Author.	Article.	Disposition.
opwood, Capt. Lucius L	Duties of ambulance companies	Military Surgeon, September, 1915.
untington, Capt. P. W	Transmissible diseases in war	New York Medical Journal, July 8, 1916.
Do	Camp sanitation	Awaiting publication.
ohnson, Capt. H. H	The trailer ambulance	Military Surgeon, July, 1916.
ohnson, Capt. T. H	Diseases complicating chronic pulmonary tuberculosis.	Awaiting publication.
ones, Capt. E. C	Transportation of ambulance companies.	Military Surgeon, November, 1915.
ones, Capt. Harold W	The organization of an ambulance company.	Awaiting publication.
ones, Capt. Percy L	Individual equipment for the Hospital Corps.	Read at twenty-fourth meeting of Association of Military Surgeons, Cincinnati, Ohio, September, 1915.
Do	The hospital train de luxe	Military Surgeon, October, 1916.
ean, Col. Jefferson R	Lessons of the great war	Presidential address delivered before Association of Military Surgeons, Washington, Sept. 13, 1915. Military Surgeon, October, 1915.
Do	New rôle of American Red Cross	Military Surgeon, May, 1916.
eefer, Lieut. Col. F. R	The sanitary problems of trench warfare.	Read before the annual meeting of United Service Medical Society of Hawaii, Honolulu, Jan. 8, 1916; Military Surgeon, June, 1916.
ing, Capt. Edgar	The military delinquent	Read before twenty-fourth annual meeting of Association of Military Surgeons, September, 1915: Military Surgeon, December, 1915.
Do	Certain problems in the treatment of criminals who are mentally abnormal.	Read before annual meeting of Kansas conference of Charities and Corrections, Lawrence, Kans., Nov. 19, 1915; published as part of proceedings of sixteenth annual conference of Kansas Society of Charities and Corrections meeting with Kansas Society of Criminal Law and Criminology.
Do	The use of habit-forming drugs (cocaine and its derivatives) by enlisted men.	Military Surgeon, October, 1916.
a Garde, Col. Louis A., retired.	The new war surgery requires more surgeons.	Military Surgeon, March, 1916.
eslie, Lieut. S. H., Dental Corps.	Dental service in the Army	Read before Massachusetts Dental Society, May 3–5, 1916; Journal of Allied Dental Societies, N. Y., June, 1916.
yster, Maj. W. J. L	Vaccination against typhoid in the United States Army.	Journal of American Medical Association, Aug. 7, 1915.
Do	Present status of disinfection of drinking water in the field.	Read at twenty-fourth annual meeting of Association of Military Surgeons, Cincinnati, Ohio, September, 1915; awaiting publication.
cKellar, Capt. Harry R	Malingering	Awaiting publication.
addux, Capt. H. C	Hospital treatment of acute gonorrhea.	Military Surgeon, December, 1915.
ichie, Capt. H. C	Rocky Mountain spotted (tick) fever (collaborated with Dr. Houston H. Parsons).	Medical Record, Feb. 12, 1916.
Do	A tuberculosis survey of an Eskimo village.	Awaiting publication.
ller, Maj. Reuben B	Proposed equipment for the Hospital Corps soldier.	Military Surgeon, April, 1916.
Do	The new manual for the Medical Department.	Military Surgeon, March, 1916.
Do	The new field belt for medical officers.	Military Surgeon, June, 1916.
udd, Capt. Leo C	Some experiences with venereal diseases at Schofield Barracks, Hawaii.	Read before United Service Society of Hawaii, Honolulu, Feb. 5, 1916; awaiting publication.
unson, Lieut. Col. Edward L.[1]	Medical preparedness for campaign	Read before Second Pan American Scientific Congress, Washington, D. C., Dec. 27, 1915; awaiting publication.
Do	The proper function of the Medical Department in relation to general staff work.	Read at Second Pan American Scientific Congress, Washington, D. C., Dec. 27, 1915; Military Surgeon, June, 1916.
lson, Maj. Kent	An Army motor ambulance	Read before twenty-fourth annual meeting of Association of Military Surgeons, Cincinnati, Ohio, September, 1915; Military Surgeon, February, 1916.

Numerous editorial contributions to the Military Surgeon, the official organ of the Association of Mili-
y Surgeons of the United States, of which he has been the editor secretary since the last annual meeting
he association in Washington, September, 1915, have been made by this officer.

Articles by medical officers of the Army, July 1, 1915, to June 30, 1916—Continued.

Author.	Article.	Disposition.
Nelson, Maj. Kent	The use of mercury salicylate in syphilis; a record of its influence on the Wassermann reaction in 50 cases (collaborated with E. A. Anderson, M. D.).	Journal of American Medical Association, Nov. 27, 1915.
Nichols, Capt. H. J	Possible reasons for lack of protection after antityphoid vaccination.	Read by title at twenty-fourth annual meeting of Association of Military Surgeons, Cincinnati, Ohio, September, 1915; Military Surgeon, March, 1916.
O'Connor, Lieut. C. M	A record march by sanitary troops	Awaiting publication.
Owen, Col. Wm. O	Relation of the Army Medical Corps and the Medical Reserve Corps to the Medical Corps of the Organized Militia.	Read at twenty-fourth annual meeting of Association of Military Surgeons, Cincinnati, Ohio, September, 1915; Military Surgeon, December, 1915.
Patterson, Maj. R. U	The American National Red Cross in first-aid and accident prevention.	Maryland Medical Journal, June, 1916.
Phalen, Maj. J. M	Typhoid prevention by bacterial vaccine.	Read before Outgamie County (Wis.) Medical Society and officers of Second Infantry, Wisconsin National Guard, Appleton, Apr. 29, 1915 Wisconsin State Medical Journal March, 1916.
Do	The Medical Reserve Corps, U. S. Army.	Read before Tristate Medical Society Chicago, Ill., Oct. 7, 1915; Chicag Medical Record, March, 1916.

Do.	The civilian physician's part in the scheme of preparedness.	Do.
Wilcox, First Lieut. R. W., Medical Reserve Corps.	Medical Corps in peace and war.	Address delivered before graduate class of Army Medical School, Washington, D. C., June 1, 1915; Military Surgeon, July, 1915.
Wilde, Capt. A. G.	Army medical records.	Awaiting publication.
Wolfe, Maj. Edwin P.	Duties of Medical Supply officers and their methods (collaborated with Col. H. I. Raymond).	Military Surgeon, July, August, September, and October, 1916.

SANITARY TROOPS—NATIONAL GUARD.

Since the date of last report the following new organizations have been completed up to June 30, 1916: 4 ambulance companies, 3 field hospitals, and 14 detachments, making a total of 22 ambulance companies, 31 field hospitals, and 174 detachments. Since June 30 there have been completed 4 ambulance companies and 7 field hospitals, making a total of 8 ambulance companies and 10 field hospitals organized since last report. The following table shows the existing sanitary units and the number required for the 12 National Guard divisions, also the States furnishing same, and those deficient:

Division.	States comprising divisional districts.	Organized.	Shortage.
Fifth	Maine, none; New Hampshire, 1 F. H.; Vermont, none; Massachusetts, 2 F. H. and 2 A. C.; Connecticut, 1 F. H. and 1 A. C.; Rhode Island, 1 A. C.	4 F. H. 4 A. C.	None.
Sixth	New York, 4 F. H. and 4 A. C.	4 F. H. 4 A. C.	Do.
Seventh	Pennsylvania, 2 F. H. and 2 A. C.	2 F. H. 2 A. C.	2 F. H. 2 A. C.
Eighth	New Jersey, 1 F. H. and 1 A. C.; Delaware, none; District of Columbia, 1 F. H.; Maryland, 1 F. H. and 1 A. C.; Virginia, 1 F. H.; West Virginia, none.	4 F. H. 2 A. C.	2 A. C.

Division.	States comprising divisional districts.	Organized.	Shortage.
Ninth	North Carolina, 1 F. H. and 1 A. C.; South Carolina, 1 F. H.; Georgia, 1 F. H.; Florida, 1 F. H.	4 F. H. 1 A. C.	3 A. C.
Tenth	Kentucky, 1 F. H. and 1 A. C.; Tennessee, 1 F. H. and 1 A. C.; Alabama, 1 F. H. and 1 A. C.; Mississippi, none.	3 F. H. 3 A. C.	1 F. H. 1 A. C.
Eleventh	Ohio, 3 F. H. and 2 A. C.; Michigan, 1 F. H. and 2 A. C.	4 F. H. 4 A. C.	None.
Twelfth	Illinois, 2 F. H.; Indiana, 1 F. H. and 2 A. C.	3 F. H. 2 A. C.	1 F. H. 2 A. C.
Thirteenth	Iowa, 1 F. H. and 1 A. C.; Wisconsin, 1 F. H.; Minnesota, none; North Dakota, none; South Dakota, none.	2 F. H. 1 A. C.	2 F. H. 3 A. C.
Fourteenth	Colorado, 1 F. H.; Nebraska, 1 F. H.; Missouri, 1 F. H. and 1 A. C.; Kansas, none; Wyoming, none.	3 F. H. 1 A. C.	1 F. H. 3 A. C.
Fifteenth	Louisiana, 1 F. H.; Oklahoma, 1 F. H. and 1 A. C.; Texas, 1 F. H.; Arizona, none; New Mexico, none; Arkansas, none.	3 F. H. 1 A. C.	1 F. H. 3 A. C.
Sixteenth	California, 1 F. H. and 1 A. C.; Utah, 1 F. H.; Washington, none; Oregon, none; Idaho, none; Nevada, none.	2 F. H. 1 A. C.	2 F. H. 3 A. C.
	Total	38 F. H. 26 A. C.	10 F. H. 22 A. C.
	Total units	64	32.

While this increase in sanitary units is encouraging, it was largely due to mobilization of the National Guard, with prospects of active service. Newly organized sanitary units, under most favorable conditions, could not be made ready for efficient service in campaign within a less period than six months of intensive training after receiving their equipment and transportation. The formation of these organizations should not await the necessity for them by a threatened conflict. They should be organized, equipped, and trained in time of peace. If this mobilization results in impressing upon the medica profession and the responsible State authorities the necessity of adequate sanitary units, properly trained and equipped in time of peace it will have done much toward the cause of preparedness.

The strength of the sanitary troops on June 30 was 884 officer and 4,436 enlisted men, a total gain of 884 during the year. Th strength has been greatly augmented since mobilization by new units and detachments, also by increasing the personnel of organizations to war strength.

Out of a total of 884 commissioned officers, 125 were not inspected Of 4,436 enlisted men, 539 were absent from the inspection. Whil this is an improvement over last year, yet it is a large number fo which there is no accurate information as to their suitability an qualifications for military service.

In the majority of the States the efficiency of the sanitary troop relative to organization, training, and equipment shows improvement over last year, although it is far from having reached th desired standard which is necessary if immediate use of these organizations for campaign is considered. The degree of efficiency differ widely. In many States but a short period of preparation would b needed to make the sanitary troops ready for field service. In others however, much time and labor would be required.

INSTRUCTION AND TRAINING.

In addition to the number of inspector-instructors reported las year, one other was authorized and assigned to the States comprisin the fifth division, making a total of 6 medical officers of the Regul Army on this duty. All have shown commendable zeal in their effor o increase interest among the sanitary troops, and to improve their fficiency, but the number is entirely inadequate to accomplish the esults desired. However, the results have been so gratifying and he numerous requests from States for additional officers, warrants he detailing of at least five or six medical officers to each of the 12 livisional districts. This would make it possible for frequent visits f instruction to sanitary organizations, while with the present numer only two visits of instruction can be made to the organizations n the district to which the inspector-instructor is assigned, and this ertains only to the fifth, sixth, seventh, eighth, ninth, tenth, eleventh, welfth, and part of the thirteenth divisions. The sanitary organzations of the remaining divisions can not be accorded this opporunity for personal instruction because of lack of sufficient inspectornstructors. The number of sergeant-instructors for sanitary troops vas increased during the year by three at the earnest request of the Iilitia Bureau, making a total of 15 on this important duty. The esult of their work warrants the detailing of a sergeant of the Medical Department for each National Guard sanitary unit, and sufficient dditional ones to provide adequate instruction to the sanitary letachments. The value accruing to the Federal Government of letailing of officers and noncommissioned officers with the National uard from the viewpoint of increasing their efficiency can not be verestimated. The money spent in this way will produce results hat can not be secured by any other method.

CORRESPONDENCE COURSE.

In addition to the personal instruction, a correspondence course or medical officers of the National Guard was conducted by the aspector-instructors. Upon request, the War Department detailed ufficient medical officers from near-by posts, who, in addition to heir post duties, conducted the correspondence course in these States or which no sanitary inspector-instructors were provided. While hese officers performed the duty assigned to them in a satisfactory nanner and the medical officers of the National Guard were able to et some theoretical instruction, yet the numerous changes of staon of these officers seriously interfered with the work and made impossible to secure the good results obtained by the inspectornstructors. The policy adopted last year of having all the questions repared and sent out from the Militia Bureau establishing a uniform, ystematized, and correlated course, has proved much more satisctory than the previous method of having each inspector-instructor repare the questions for his district. It is deemed advisable to ontinue this method. More than 60 per cent of the medical officers ccessfully completed the prescribed course. No reports were ceived from some States, partly due to the mobilization order, d partly to the necessity of sending the medical officers conducting e course to the border for duty. The best showing was in States aving medical officers detailed as inspector-instructors.

PHYSICAL EXAMINATION AND TRAINING.

Recent reports received show that all States, except two, have lopted the physical standards prescribed for the Regular Army, d the majority of the States claim a rigid enforcement of same.

Reports of inspectors indicate that great laxity exists in the majority of the States in this matter, which has been confirmed by the recent mobilization. In view of the fact that the requirements of the regula service make it necessary that the physical findings at each and every enlistment and reenlistment must be passed upon by a medical officer it would appear that the Medical Corps of the National Guard was responsible for any of the personnel found physically disqualified. This is no doubt true to a certain extent. However, in order to determine to what extent they are responsible, those who were enlisted without a physical examination, those who were enlisted in spite of rejection by medical officers, and those who were examined by civilian doctors whose reputation was not at stake, should be eliminated. It is not deemed advisable to expend money on the training and instruction of men who, when needed for active service are found to be physically disqualified. Every man in the Nationa Guard should be physically qualified for any duty devolved upon him This can best be accomplished by instituting a thorough physica reexamination of each person as soon as practicable after enlisting and reenlisting in the National Guard by a medical officer of the regular service, also that the same be done annually for the commissioned personnel. In this way the physically disqualified coul be weeded out, and those having defects that are not disqualifyin could have them waived, resulting in not more (barring venerea diseases and acute maladies) than 1 per cent of the personnel bein found disqualified when called into the Federal service.

There are a large number of persons rejected for physical defects such as poor physique, deficient chest expansion, and similar defects who do not conform to the prescribed standard physical requirements but who under proper physical training would in a short time mee these requirements and be able to endure the physical strain of campaign. If more time and attention were paid to the physical development and training of a soldier, a large number of the above typ of men could in time of peace be enlisted in the National Guard an Army without decreasing its efficiency.

TYPHOID PROPHYLAXIS.

There is very little change in the status of typhoid prophylaxis a reported last year. Some States have given considerable attention t the matter, while others have not. The annual inspection repo shows that 2,481 officers and 24,866 enlisted men had received complete antityphoid prophylaxis out of a reported strength of 8,86 officers and 129,333 enlisted men, making a total of 27,347 protecte against typhoid fever out of a total strength of 138,197. As compared with the report of last year, showing 22,551 receiving comple antityphoid prophylaxis out of a total strength of 129,398, makin 19.78 per cent during the past year, as against 17.4 per cent durin the year previous. This increase is encouraging. However, t large a percentage are unprotected. It is believed the recent mobilization, which brought the National Guard under regulations prescribed for the Regular Army, requiring vaccination of all persons the Federal service, will do much toward further popularizing the preventive measures, and it is further believed that the time has arrived to make it compulsory in the National Guard, thereby makin it prepared for a hasty call into the Federal service.

ACT OF JUNE 3, 1916.

The act of June 3, 1916, contains much beneficial legislation, which, when enforced, will greatly improve the efficiency of the Medical Department of the National Guard. It provides for uniform courses of armory and field instruction, along lines prescribed for the Regular Army. It provides for an increased number of inspectors and sergeant instructors. It provides for horses for the sanitary troops, and it provides for examination of medical officers and noncommissioned officers under Federal supervision. It will mean greater devotion to duty, and acquisition of military knowledge on the part of the personnel.

CONSTRUCTION AND REPAIR OF HOSPITALS.

During the past year plans and specifications were prepared and contracts were entered into for the construction of additions to hospital buildings at the following general hospitals and military posts:

Letterman General Hospital, San Francisco, Cal.—New concrete ward, medical and surgical dispensary, addition to nurses' dormitory, and an addition to the department laboratory.

Fort Bliss, Tex.—Rear annex addition to hospital containing kitchen, mess room, and dormitories for the Hospital Corps detachment.

Fort Sam Houston, Texas.—Building for central heating plant, a department laboratory, dormitories for the Hospital Corps detachment, and a surgical pavilion.

Temporatory buildings for hospital purposes in connection with the Mexican border were also provided from the appropriation for construction and repair of hospitals at Fort Bliss, Camp Douglas, and Fort Sam Houston.

In addition to the regular annual appropriation for construction and repair of hospitals, Congress appropriated $100,000 to construct temporary buildings for hospital purposes on the Mexican border, or where necessary. Fifty-eight thousand dollars of these funds went to Brownsville, Eagle Pass, and Laredo, Tex., and Nogales, Ariz., and $25,000 to Fort Sam Houston, Tex. The $17,000 remaining will be needed for additional construction at the first four places, and request was made for $1,000,000 additional to provide for general hospitals and temporary hospital accommodations for the large number of troops on duty at the Mexican border.

The following hospital buildings which were contracted for during the fiscal year which ended June 30, 1915, have been completed: Building for central heating plant, Fort Leavenworth, Kans. Rear annex addition to hospital, Fort Oglethrope, Ga., containing kitchen, mess room, and dormitories for the Hospital Corps detachment. Clinic laboratory and nurses' dormitory, department hospital, Honolulu, Hawaii. Rear annex addition to hospital Fort Terry, N. Y., containing kitchen, mess room, and dormitories for the Hospital Corps detachment. Hospital Corps barrack building, storehouse, and one double set of noncommissioned officers quarters for the Army and Navy General Hospital, Hot Springs, Ark., also addition to ward building No. 6, operating pavillion and diet kitchen. A ward for special surgical cases, a new concrete ward, and an addition to the Nurse Corps dormitory were completed for the Letterman General Hospital, San Francisco, Cal., and a ward for ambulant patients at the General Hospital, Fort Bayard, N. Mex.

An allotment of $40,000 was made from the appropriation for construction and repair of hospitals for use in the Philippine Department during the fiscal year, and $1,000 was allotted from the appropriation for quarters for hospital stewards, for quarters for sergeants, first class, Hospital Corps, to cover the cost of construction and repair of quarters for these noncommissioned officers in the Philippine Islands.

In addition to the foregoing, all general hospitals in connection with the Army, and the hospitals at military posts were improved or kept in proper repair so far as funds would permit. Temporary hospitals for standing camps and cantonments were also provided in a number of cases.

The Army and Navy General Hospital, Hot Springs, Ark., has been improved in a manner to meet several of the most important necessities, and it is believed that sufficient additional accommodations fo patients can be provided when required by inclosing the porches wit glazed sash, thus avoiding the necessity for further ward buildings and no new construction is estimated for this general hospital for th fiscal year 1918.

General Hospital, Fort Bayard, N. Mex.—A few years ago authorit was given to erect three additional ward buildings for this genera hospital, but it was possible to enter into contact for the erection o only two of these wards, and the following buildings are now necessary: One infirmary for enlisted men, estimated to cost $50,000; on infirmary for officers, estimated to cost $60,000, and an addition to th officers' dormitory, estimated to cost $40,000, or a total of $150,000 and funds for these buildings have been included in the annual estimate for the fiscal year 1918.

Letterman General Hospital, San Francisco, Cal.—The wards of thi hospital are constructed of wood, and have been in use for quite number of years, and are dangerous in case of fire. It is proposed t safeguard the lives of patients by replacing these wooden building from time to time with reinforced concrete structures, and $75,000 i included in the annual estimate for the fiscal year 1918, to be used fo this purpose.

Walter Reed General Hospital, Takoma Park, D. C.—This is one four general hospitals. It is one of the most important, and is use for the treatment of officers, retired officers, patients from Washin ton Barracks, enlisted men, special cases, observation of patien under consideration for discharge on account of disability, and for t education of students attending the Army Medical School. Ne buildings and additions have been erected from time to time. Tw new one-story wards have lately been added to the east and west en of the administration building, and these two ward wings require a ditional stories to complete them. The additional room is necessa and these improvements are estimated to cost $90,000, and funds f this purpose have been included in the annual estimate for the fisc year 1918.

As stated in previous reports, new modern hospitals are requir at various military posts to replace old and dilapidated structur which have been in use for many years, and which require large sur of money annually for repairs and improvements. New buildings of modern type would be economical, but it is impossible to erect a suitable modern military hospital for the maximum sum allowed by aw from the general appropriation for such purposes. Section 1136, Revised Statutes of the United States, limits the cost of permanent structures to $20,000, unless special authority is first obtained from Congress. This law was enacted in or before 1859 when material and labor were much lower in price than they are at present, and before many modern plumbing and other necessary fixtures were available which are now indispensable. The statute limiting cost should be modified to suit present conditions.

Fort Michie, N. Y.—The hospital at this post is a temporary wooden structure, and the inspecting officer stated September 14, 1915, that the hospital building is unsuitable, and if it is intended to maintain a permanent garrison at Fort Michie, a new hospital will be needed. In 1905, the Secretary of War authorized the use of funds to erect a new hospital at this post, but owing to location, cost of transportation, etc., it was not possible to erect a suitable hospital within the limit of cost fixed by section 1136, Revised Statutes of the United States. A modern hospital for this post is estimated to cost $30,000.

Fort McPherson, Ga.—The hospital at this post is in size entirely nadequate. It is located in close proximity to a railroad and has no cellar except a small excavation for a heating apparatus, which was made some years after the building was erected. The heating and ventilation are not suitable for a modern hospital. The plumbng is crude, and efforts have been made from time to time to improve t, but it falls far short of meeting the modern sanitary requirements. The operating room is located in a small annex, with a small laboraory adjoining. There is no instrument room, etherizing room, preparation room, nor surgical ward. There is no suitable ward for the solation of contagious diseases, nor prison ward; and the Hospital Corps detachment is quartered in an old temporary wooden building which was erected for use as a ward during the Spanish-American War. The mess room and kitchen are too small and are unsuited for heir purpose, it being necessary to set tables two or three times to ccommodate the patients. The entire hospital is such that it would be in the interest of economy to replace it with a modern structure. A hospital should be erected with a capacity of 87 beds for patients, necessary attendants, noncommissioned officers, etc. The estimated ost of such a building is $90,000.

Fort Dade, Fla.—In 1910 the surgeon at this post recommended hat a new hospital be erected, and stated:

> The kitchen and dining room are near the center of the building, and it is necessary pass through them in going from the operating room to the ward. The ward is too mall, and the quarters for hospital corps men are inadequate. It is not believed hat the present structure can be remodeled to meet the requirements of a modern ospital.

The present hospital is entirely inadequate and unsuitable. It is temporary structure with crude plumbing, lacks modern appliances, nd the conditions are such that they can only be remedied by the rection of a new hospital. A suitable building is estimated to cost 35,000.

Schofield Barracks, Hawaii.—The department authorities prepare
sketch plans for a 250-bed hospital, which is considered necessary fo
this post. An approximate estimate of the contemplated strengt
of the garrison of Schofield Barracks is 6,000 men, and this wil
require the number of beds estimated for. In addition to the be
capacity, other buildings will be needed in the future to complete th
group, but six wards and an administration building will be sufficien
for the present. The estimated cost of these buildings is $150,000.

Army Medical School.—This school occupies a rented building i
the city of Washington, at a rental of $8,680 per annum. As it i
one of the permanent service schools it would be much more economi
cal, as well as more fitting and convenient, for it to be housed i
buildings erected by the Government. It is proposed to locat
these on the tract of land occupied by the Walter Reed Genera
Hospital, so that the students may have the clinical advantages an
the instruction in administration afforded by the hospital, and tha
the hospital may enjoy the laboratory conveniences of the school
These buildings are estimated to cost $350,000.

Quarters for sergeants, first class, Hospital Corps.—Owing to th
limited appropriation for these buildings, it was not possible to erec
additional quarters, and various necessary additions and improv
ments had to be disallowed. A number of large military posts ar
in need of such quarters for these noncommissioned officers, and th
appropriation should be liberal until such time as the Hospital Cor
sergeants are supplied with suitable habitations. Eleven single se
and seven double sets of these quarters are needed, but only the mos
necessary are included in the annual estimate for the fiscal year 191

Estimates for new construction which is essential to the proper ca
of the sick have been for some years lopped off the estimates i
accordance with the instructions of the Secretary of War in order t
reduce the War Department estimates until the necessities of t
department, in this respect, have become very urgent and have acc
mulated to a large total. The following are the items which are co
sidered to be most necessary, and are accordingly included in t
estimates laid before the Secretary of War for the fiscal year 1918:

New construction:	
Army general hospital, Fort Bayard, N. Mex	$150, 0
Letterman General Hospital, San Francisco, Cal	75, 0
Walter Reed General Hospital, Takoma Park, D. C	90, 0
Fort Michie, N. Y	30,
Fort McPherson, Ga	90,
Fort Dade, Fla	35,
Schofield Barracks, Hawaii	150,
To enlarge and improve hospitals at Artillery posts	50,
Additions and repairs, general hospitals	65,
Repairs, hospitals, all posts in the United States	200,
Repairs, Hawaiian Department	30,
Repairs, Philippine Department	50,
Army Medical School	350,
Total for construction and repair of hospitals	1, 365,
Hospital Corps sergeants' quarters:	
6 single sets, new quarters	21,
4 double sets, new quarters	26,
Philippine Islands, repairs, etc	1,
Repairs, all posts in the United States	15,
Total for Hospital Corps sergeants' quarters	63,

MEDICAL AND HOSPITAL SUPPLIES.

The appropriation made by Congress for the fiscal year 1916 for ie support of the Medical Department was $787,500, this being $7,500 more than the amount appropriated for the fiscal year 1915.

The new Manual for the Medical Department was completed and eady for promulgation about June 15. It is being issued by The djutant General of the Army. This manual prescribes a medical fficer's belt and a belt for the Hospital Corps medical equipment, oth recommended by the equipment board. The latter is intended take the place of the pouch, Hospital Corps, M. M. D., 1911. ince this new personal equipment has been approved various diffi- ılties have arisen with reference to the manufacture of the other rdnance equipment which should be issued with it. The issue of is equipment is therefore being held in abeyance, and the old equip- ent will be continued in use for the present.

The medical supply depot at Galveston, Tex., being no longer eeded, was discontinued about January 7, 1916. Field medical ıpply depots have been established at San Antonio and El Paso, ex., for the purpose of promptly furnishing supplies to the border mps. A reserve medical supply depot was also temporarily estab- shed at the advance base, Columbus, N. Mex. Later this was dis- ntinued, it being decided that all necessary supplies for this vicinity uld be satisfactorily obtained from the El Paso depot. In addi- on a divisional reserve supply was furnished to the punitive expe- tion and located at Colonia Dublan, Mexico. A new medical sup- y depot for the storage and issue of both post and field supplies as established in Honolulu, Hawaii, in March, 1916.

Motor ambulances have been furnished to the ambulance companies in Mexico, and field hospital No. 7 has been equipped with otor trucks. Ambulances of the following type have been pur- ased: G. M. C., Buicks, White, Service, and Fords. Trailers were so furnished with these ambulances for trial. The light cars and ailers were found to be unsatisfactory for use in Mexico.

At the beginning of the militia mobilization period the officers in arge of the medical supply depots at New York and St. Louis were rected to purchase full ward equipment for one hundred 50-bed rds as promptly as possible, with a view to having these complete uipments ready for emergency use on the border.

Sufficient typhoid and smallpox vaccines were furnished to each bilization camp for the immunization of the Organized Militia, d a camp hospital was furnished to each mobilization camp not ated at a post for the care and treatment of members of the Orga- ed Militia who required such attention at the camp. The post spital and medical supplies were available for the use of all mobili- tion camps located at Army posts.

ARTIFICIAL LIMBS AND APPARATUS.

Under the laws relating to artificial limbs and apparatus or com- tation therefor, orders on manufacturers were given during the al year for 22 artificial legs and 1 foot. Commutation certifi- es were issued for 129 cases of amputated leg, 77 of amputated n, 9 of amputated foot, and 1,320 cases of loss of use of limb.

Under the act of June 17, 1870, and subsequent amendments thereto, 23,703 disabled soldiers and sailors have been furnished artificial limbs and apparatus or have received commutation in money since the passage of the act, as follows:

Total number benefited to June 30, 1916	23,703
Died	16,053
Dropped from rolls	592
Rejected after one or more payments	572
Remaining on rolls at end of fiscal year	6,486
Loss of beneficiaries during the year	367

It is estimated that the sum of $210,000 will be required to pay the claims during the fiscal year ending June 30, 1918.

APPLIANCES AND TRUSSES.

One hundred and sixteen appliances were issued during the fiscal year ending June 30, 1916, and 204 trusses for disabled soldiers were furnished and fitted.

LIBRARY OF THE SURGEON GENERAL'S OFFICE.

During the year 430 books and 3,407 pamphlets and journals were presented to the library, and 256 portraits were added to the collection. The library now contains 226,128 volumes, bound and unbound (of which 191,802 are bound), and 337,110 pamphlets, a total of 563,238 volumes and pamphlets. It is now receiving 1,895 periodicals exclusive of transactions of societies. Eight hundred and two volumes were bound during the year. The following table shows in detail the additions made to the library during the year:

	On hand June 30, 1915.	Added during fiscal year.	Total June 30, 1916.
Medical journals	60,480	1,895	62,37
Medical transactions	8,990	47	9,03
Bound theses	3,099	492	3,59
Other bound volumes	113,068	3,731	116,79
Total	185,637	6,165	191,80
Unbound volumes	33,888	438	34,3
Pamphlets	241,653	95,457	337,11
Total	275,541	95,895	371,4

Volume XXI of the second series of the Index Catalogue is in cours of preparation and will appear in due time. A complete list, arrange alphabetically, of the medical periodicals and transactions of socie ties in the library will be published with this, the concluding volum of the second series of the catalogue.

To meet the needs of the library in its scientific and technic branches, the following changes have been submitted in the estimate

Principal assistant librarian, from $2,250 to $2,500 per annum, an increase of	$2
Assistant librarian, from $1,800 to $2,000 per annum, an increase of	2
Superintendent of reading room, $1,800 (from clerk at $1,600), an increase of.	2
Superintendent of library hall, $1,800 (from clerk at $1,400), an increase of.	4
Total increase	1,0

Of this increase, $500 was made up last year by the abolition of one clerkship at $900 with this end in view. The net increase asked for over former appropriations is, therefore, $550.

These increases are necessary to give salaries equivalent to those paid in other departments of the Government (Library of Congress, etc.). The salaries in this library have been at a standstill for many years, while other departments have had increases. This was due, perhaps, principally to the fact that the employees here have been mostly designated as clerks, although doing the same class of work as men with professional titles elsewhere. The change is especially necessary in view of the very large Army expansion now taking place. It is hoped that the continued efficiency of the library may be provided for in this way by Congress at its next session.

It is also urgently recommended that the following provision be nserted in the legislative, executive, and judicial bill:

> SUNDAY OPENING: To enable the library of the Surgeon General's Office to be kept open for reference use from four-thirty until ten o'clock, post meridian, daily, nd from two until ten o'clock post meridian on Sundays and legal holidays, within he discretion of the librarian, including the extra services of employees and the ervices of additional employees under the librarian, $5,000, or so much thereof as may be necessary."

This would put the Surgeon General's library on the same basis as to opening as the Library of Congress, and it is asked for in response to urgent demands from the medical profession of the country for mproved service by the library.

ARMY MEDICAL MUSEUM.

The total number of specimens in the museum at the close of the fiscal year June 30, 1916, is 47,313.

The following statement shows in detail the additions and changes in the different sections:

Pathological section:		
In museum June 30, 1915		13, 03
Discarded	5	
Donated	123	
		12
		12, 91
Received during the year		17
In museum June 30, 1916		13, 08
Anatomical section:		
In museum June 30, 1915		1, 20
Received during the year		4
In museum June 30, 1916		1, 25
Comparative anatomy section:		
In museum June 30, 1915		62
Donated		2
In museum June 30, 1916		60
Microscopical section: In museum June 30, 1915 and 1916		12, 91
Miscellaneous section:		
In museum June 30, 1915		3, 97
Discarded		
		3, 97
Received during the year		4
In museum June 30, 1916		4, 01
Provisional anatomy section: In museum June 30, 1915 and 1916		29
Photographic section including negatives:		
In museum June 30, 1915		14, 94
Received during the year		20
In museum June 30, 1916		15, 14

RECAPITULATION.

In museum June 30, 1915	46, 99
Discarded and donated	15
	46, 84
Added during the year	47
In museum June 30, 1916	47, 31

The following are some of the more interesting specimens received uring the year ending June 30, 1916:

Malformations.—Specimen 14491, a pig showing syncephalus; urchased. Specimen 14621, male infant showing dicephalus ibrachius; purchased. Specimen 14479, skull of idiot showing icrocephaly; capacity 765 cubic centimeters; purchased. Specimen 4455, skull of adult showing deformity caused by premature closure of utures; purchased. Specimen 14621, dicephalus dibrachius, human; urchased.

Ectopic pregnancy.—Specimen 14406, tubal pregnancy at two onths removed by operation; recovery; woman, aged 42. Con-ributed by Capt. J. W. Hanner, Medical Corps, United States Army.

Animal parasites.—Specimen 14587, hookworm exhibit of the nternational Health Commission; consists of models, transpar-ncies, photographs, and stereomotograph. Specimen 14511, filaria anguinis hominis Bancrofti. Contributor, Dr. Leonel Plasencia, abana, Cuba. Specimens 14624–14626, Echinococcus cysts in ver and spleen; soldier, aged 22. Died suddenly. Contributed by apt. C. T. King, Medical Corps, United States Army.

Fibro-sarcoma of leg.—Specimen 14494, soldier, aged 35; amputa-ion of leg; recovery. Contributed by Maj. G. A. Skinner, Medical orps, United States Army.

Hernia through diaphragm.—Specimen 14457, colon through dia-hragm; man, aged 40; had lifted heavy weight; died the thirteenth ay. Contributed by Col. G. L. Edie, Medical Corps, United States rmy.

Quintuplets.—Specimen 14503, born at seven and a half months; ll males; one placenta; five cords; lived from 5 to 15 days; purchased. xceedingly rare; about once in more than a million births.

Amebic dysentery.—Specimen 14461, large ulcers of colon, edges artly healed; soldier, aged 57; died of bowel obstruction from peri-oneal adhesions. Contributed by Col. H. C. Fisher, Medical Corps, nited States Army.

Brain.—Specimen 14471, acute meningitis from streptococcus; an, aged 35. Had protrusion of eyes and thrombus in ophthalmic eins. Original cause believed to have been a boil on the nose. ontributor Dr. J. H. Bryan, Washington, D. C. Specimen 14451, ute purulent meningitis, from staphylococcus pyogenes aureus. ldier, had acute endocarditis (see 14452). Contributed by Capt. W. Griesinger, Medical Corps, United States Army. Specimen 405, abscess in left frontal lobe, streptococcus and pneumococcus. rom an old soldier who had a small abscess also in mediastinal mphatic nodes. Contributor, Capt. A. D. Tuttle, Medical Corps, nited States Army.

Heart.—Specimen 14493, adhesive pericarditis; calcareous plates. me case as 14492, cancer of liver. Contributor, Capt. C. L. Cole, edical Corps, United States Army. Specimen 14452, acute endo-rditis vegetations on mitral valve; soldier. Same case as 14451, eningitis. Contributor, Capt. J. W. Griesinger, Medical Corps, nited States Army. Specimen 14510, acute gonorrheal endocarditis; lture showed gonococci; soldier, aged 26. Contributor, Col. G. L. die, Medical Corps, United States Army.

Goiter.—Specimen 14472, adenoma, from a man. Contributor, pt. D. P. Card, Medical Corps, United States Army.

Myelogenous leukemia.—Specimen 14622, spleen weighing 8½ pounds. Soldier, aged 41. Had been ill about a year. Contributor, Capt. A. D. Tuttle, Medical Corps, United States Army.

Teeth.—Specimens 14463 to 14465, anomalies and diseases. Contributor, First Lieut. H. G. Voorhies, Dental Corps, United States Army.

Duodenum perforating ulcer.—Two cases, specimen 14458, soldier, aged 28, was ill three days, had had "indigestion." Also specimen 14459, a soldier. Both specimens contributed by Capt. H. J. Nichols, Medical Corps, United States Army.

Appendicitis.—Specimen 14623, large concretion in appendix; from a soldier; appendectomy; recovery. Contributor, Capt. C. E. Doerr, Medical Corps, United States Army.

Ileum.—Diverticulum, specimen 14627, causing fatal bowel obstruction. Contributor, First Lieut. S. T. Millard, Medical Corps, United States Army.

Liver.—Specimen 14508, shot laceration; soldier; died four hours after injury. Contributor, Capt. H. J. Nichols, Medical Corps, United States Army. Specimen 14568, abscess; amebæ not found; man, aged 37, had been fireman 15 years on transport. Contributor, Capt. W. H. Allen, Medical Corps, United States Army. Specimen 14492 primary carcinoma, weight 11 pounds 2 ounces; soldier; had also adhesive pericarditis (14493), Contributor, Capt. C. L. Cole, Medical Corps, United States Army. Specimen 14509, common bile duct obstructed by gallstone; woman; aged 45; had had epigastric pain for 16 years; obstructive jaundice for 2 months; hemorrhage from bowel. Contributor, Col. G. L. Edie, Medical Corps, United States Army.

Urinary organs.—Specimen 14456, kidney; weight, 46 ounces; multiple cysts and miliary abscesses; other kidney in same condition; man, aged 47; specimen removed after death. Contributor, Lieut. T. S. Proxmire, Medical Reserve Corps, United States Army. Renal calculi, three cases; specimens 14467, 14468, and 14469; from soldiers removed by operation; recovery. Contributed by Capt. J. W. Hanner, Medical Corps, United States Army. Specimen 14462, calculus from ureter; discharged through urethra; man, aged 18. Contributor, Capt. J. L. Robinson, Medical Corps, United States Army Specimen 14470, calculus from urinary bladder; removed by operation, recovery; soldier. Contributor, Capt. J. W. Hanner, Medica Corps, United States Army. Specimen 14629, laceration of kidney from kick of mule; nephrectomy; recovery. Contributor, Maj. R. F Metcalfe, Medical Corps, United States Army. Specimen 14628 uterine fibroid; woman, age 41; hysterectomy. Contributor, Capt W. H. Moncrief, Medical Corps, United States Army.

Bone.—Specimens 14497 to 14499, multiple injuries; specimen 14497, healed fracture right radius; specimen 14498, dislocation righ hip joint; head of femur atrophied; acetabulum perforated; specimen 14499, healed fracture left femur. From woman about 38 year of age; purchased. Specimens 14577, 14578, osteomalacia; sku and pelvis; from an idiot, aged 26, who had also spondylitis deformans; purchased. Specimens 14569 to 14586, series of bone from Indian burial places, showing anomalies, fractures, and inflammation. Contributor, Clarence Moore, Philadelphia, Pa. Also series bones showing anomalies, inflammation, fractures, and dislocations. Purchased.

Anatomical dissections.—Specimens 4177 to 4184 and 4189 to 4192, series of normal preparation of joints and muscles; purchased. Specimen 4162, dissection of arm, forearm, and hand. Contributor, Dr. Edmond Souchon, New Orleans, La.

Miscellaneous.—Specimen 4179, a prosthetic appliance made by Dr. J. P. Michaels, dentist, Paris, France, to replace excised portion of humerus. Contributed by Dr. E. A. Bogue, New York City. Specimen 4178, Sims's duckbill speculum, presented by Dr. Sims to Prof. Alonzo B. Palmer, of University of Michigan, by him to the father of Maj. W. J. L. Lyster, Medical Corps, United States Army, who gave it to the museum. Specimens 4154 to 4177, series of first-aid packages, missiles, etc., from the European war. Contributor, Maj. J. H. Ford, Medical Corps, United States Army.

DENTAL AND ORAL DISEASES.

TABLE No. 47.—*Dental and oral diseases, year 1915, officers and enlisted men.*

	Cases admitted to treatment.		Operations performed.	
	Number.	Ratio.	Number.	Ratio.
United States (continental) exclusive of Alaska	72,747	1,089.21	88,663	1,327.51
Philippine Department	17,777	987.34	18,539	1,029.66
Hawaiian Department	14,442	1,627.08	15,198	1,712.26
Canal Zone, Panama	6,516	1,103.85	7,603	1,287.99
China	1,244	902.76	1,019	739.48
Alaska	798	1,013.98	832	1,057.18
Total	113,524	1,115.85	131,854	1,296.02

DENTAL CARIES—NUMBER OF TEETH TREATED.

	White troops.		Colored troops.		Philippine Scouts.		Total.	
	Number.	Ratio.	Number.	Ratio.	Number.	Ratio.	Number.	Ratio.
United States (continental) excluding Alaska	41,043	637.81	740	303.40	....	....	41,783	625.60
Philippine Department	7,919	709.65	667	497.39	2,117	384.56	10,703	594.45
Hawaiian Department	7,510	1,070.87	1,841	988.19	....	....	9,351	1,053.52
Canal Zone, Panama	3,669	621.55	....	....	....	....	3,669	621.55
China	764	554.43	....	....	....	....	764	554.43
Alaska	592	752.22	....	....	....	....	592	752.22
Total	61,497	678.85	3,248	575.58	2,117	384.56	66,862	657.20

While the tabulation above given does not portray the character of the work performed, which has been varied, yet it indicates either that the dental work of the past years has placed the teeth of those treated in such condition as not to warrant treatment this year, or that the condition of the teeth of new recruits are closely watched with a view to eliminating those not meeting the requirement in this respect. It is to be noted that the troops serving in the Canal Zone have next to the highest admission rate for dental treatment, the Hawaiian Department leading.

AMERICAN TROOPS.

The movement of recruits is shown in Table No. 48. There were 37,993 examined by medical officers, as compared with 57,244 for the year 1914. Of each 1,000 examined, 125.84 were rejected and 21.08 declined enlistment, as compared with 106.60 and 24.46, respectively, for 1914. Of each 1,000 examined by medical officers, 853.08 were accepted, as compared with 868.94 for 1914. Of the number examined and enlisted, 494.91 per 1,000 were original enlistments and 358.17 reenlistments, as compared with 502.62 and 366.32 for 1914.

The minimum standard chest measurement for American recruits is 32 inches at expiration. Forty-seven and nine hundredths of 1 per cent of all Philippine recruits have a chest measurement below the standard.

Table No. 64 gives the cause of rejection among 1,090 Filipino applicants for enlistment, examined by medical officers during the year.

TABLE NO. 64.—*Causes of rejection of Philippine applicants for enlistment, 1915.*

Causes of rejection.	Total.		Causes of rejection.	Total.	
	Number.	Ratio per 1,000 rejected for all causes.		Number.	Ratio per 1,000 rejected for all causes.
Heart disease	41	209.18	Hernia	3	15.31
Underweight	22	112.25	Underheight	3	15.31
Diseases of the eye, including defects of vision	19	96.94	Diseases of the digestive system	2	10.20
Tuberculosis	17	86.74	Chest development insufficient	2	10.20
Genito-urinary system, nonvenereal	15	76.54	Flat feet	2	10.20
General diseases except as mentioned in detail	11	56.10	Varicose veins	1	5.10
Defective teeth	9	45.92	Defects of development except as shown in detail	1	5.10
Diseases of the ear including defects of hearing	8	40.82	Injuries	2	10.20
Diseases of the respiratory system	7	35.72	Rejected for causes physical and mental	177	903.06
Venereal diseases	4	20.41			
Diseases of the skin	4	20.41	Rejected for causes not physical	19	96.94
Diseases of the organs of locomotion	4	20.41	Total rejected	196	1,000.00

Heart disease caused 20.92 per cent of all rejections by medical officers; diseases of the eye, including defects of vision, 9.69 per cent; tuberculosis, 8.67 per cent, genito-urinary system, nonvenereal, 7.65 per cent, and general diseases, except as mentioned in detail, 5.61 per cent. Venereal disease, which last year caused 5.67 per cent of all rejections, in 1915 caused 2.04. Twenty-two applicants were rejected because of underweight, a total of 11.22 per cent of all rejections, while but 2, or 1.02 per cent, were found to have insufficient chest development.

PORTO RICAN TROOPS.

Ninety and three one-hundredths per cent of the recruits examined by medical officers, for the Porto Rican Regiment, were accepted, as compared with 91.44 per cent in 1914. Two hundred and seventy-one applicants were examined, and 244 accepted, of which number only 47 were first enlistments. Of the causes of rejection, 37.03 per cent were for underweight; 14.81 for venereal diseases, 7.47 for underheight, and 3.70 for insufficient chest development.

In height 51.64 per cent were 66 inches or under and only 6.56 per cent attained the height of 69 inches. Sixty-eight and eighty-five one hundredths were under the average height of American recruits; 38.52 per cent weighed less than 130 pounds, and 31, or 13.92 per cent, weighed over 150 pounds. Seventy-one and thirty-one one hundredths per cent had a chest measurement of 33 inches or under, and 10.06 had a chest measurement of 35 inches and over, as compared with 13.45 per cent last year.

Applicants.	Number.	Ratio per 1,000 examined.
Examined by medical officers	271	1,000.0
Accepted by medical officers	244	900.3
By first enlistment	47	173.4
Other enlistments	197	726.9
Rejected by medical officers	27	99.6
Declined	....	....

		2,223.9

Army Medical Museum, 1915.

Balance on hand July 1, 1915, act Apr. 27, 1914		3,224.5
Disbursed during the year		763.8
Balances on hand June 30, 1916:		
In United States Treasury	$1,918.56	
In hands of disbursing officer	542.21	
		2,460.7

Army Medical Museum, 1914.

Balance on hand July 1, 1915, act Mar. 2, 1913	1,565.8
Carried to surplus fund	1,565.8

Artificial limbs, 1916.

Appropriated by act approved Mar. 3, 1915		95,000.
Disbursed during the year		79,674.7
Balances on hand June 30, 1916:		
In United States Treasury	$11,817.26	
In hands of disbursing officer	3,508.00	
		15,325.

Artificial limbs, 1915.

Balance on hand July 1, 1915, act Aug. 1, 1914	47,363.
Disbursed during the year	1,677.
Balance on hand June 30, 1916, in United States Treasury	45,686.

Artificial limbs, 1914.

Balance on hand July 1, 1915, act June 23, 1913	11,046.
Carried to surplus fund	11,046.

Trusses for disabled soldiers, 1916.

Appropriated by act approved Mar. 3, 1915		3,000.
Disbursed during the year		1,440.
Balances on hand June 30, 1916:		
In United States Treasury	$1,400.00	
In hands of disbursing officer	159.04	
		1,559.

Trusses for disabled soldiers, 1915.

Balance on hand July 1, 1915, act Aug. 1, 1914	1,886.
Disbursed during the year	177.
Balance on hand June 30, 1916, in United States Treasury	1,708.

Trusses for disabled soldiers, 1914.

Balance on hand July 1, 1915, act June 23, 1913	1,997.
Carried to surplus fund	1,997.

Appliances for disabled soldiers, 1916.

ppropriated by act approved Mar. 3, 1915		$1,500.00
isbursed during the year		802.24
lances on hand June 30, 1916:		
In United States Treasury	$500.00	
In hands of disbursing officer	197.76	
		697.76

Appliances for disabled soldiers, 1915.

lance on hand July 1, 1915, act Aug. 1, 1914	797.11
sbursed during the year	106.26
lance on hand June 30, 1916, in United States Treasury	690.85

Appliances for disabled soldiers, 1914.

lance on hand July 1, 1915, act June 23, 1913	1,090.01
rried to surplus fund	1,090.01

General summary of all appropriations.

lances on hand July 1, 1915	391,912.68
propriated	947,013.60
crued to replacing funds, act June 12, 1906 (34 Stats., 256)	121,472.61
fundments during the year	67.83
nsfers between appropriations, debits	284.05
Total to be accounted for	1,460,750.77
bursed during the year	975,886.39
nsfers between appropriations, credits	284.05
asury settlement on account of duplicate deposit	23.00
ried to surplus fund	22,247.66
lances on hand June 30, 1916	462,309.67
Total accounted for	1,460,750.77

VITAL STATISTICS.

The following tables show in detail most of the statistical data on which the statements in this report are based:

6. Surgical operations performed on American troops.

7. Numerical view of the effect of disease and injury on United States troops ving at home and abroad in the year 1915, compared with the corresponding data the year 1914, by races.

8. Admissions to sick report, discharges and deaths in the Army, with ratios per 00 of mean strength, in which all available data for the decade ending December 1914, are placed in comparison with the year 1915.

8½. Admissions to sick report, discharges, deaths, and noneffectiveness, with os per 1,000 of mean strength, for the Army; separately for officers, total enlisted luding American, Porto Rican, and Philippine troops), and grand total, year 5.

). Admissions to sick report, discharges, deaths, and noneffectiveness, with os per 1,000 of mean strength, for the Army; officers, total enlisted American ps, and grand total, year 1915.

). Admissions to sick report, discharges, deaths, and noneffectiveness, with os per 1,000 of mean strength, for the Army, American troops, total enlisted, and arately for white and colored.

)½. Admissions to sick report, discharges, deaths, and noneffectiveness, with os per 1,000 of mean strength, for the United States, continental (excluding Alaska), arately for officers and enlisted men, and the grand total.

71. Admissions to sick report, discharges, deaths, and noneffectiveness, with ratios per 1,000 of mean strength, for the year 1915, United States, continental (excluding Alaska), total enlisted, white and colored: and separately for the white and colored troops (enlisted) serving therein.

71½. Admissions to sick report, discharges, deaths, and noneffectiveness, with ratios per 1,000 of mean strength, for the officers separately; total enlisted, including Philippine Scouts: and total officers and enlisted men, including Philippine Scouts, serving in the Philippine Islands, for the year 1915.

72. Admissions to sick report, discharges, deaths, and noneffectiveness, with ratios per 1,000 of mean strength, for total American troops, enlisted men, white and colored; and separately for white and colored American enlisted men serving in the Philippine Islands, year 1915.

73. Admissions to sick report, discharges, deaths, and noneffectiveness, with ratios per 1,000 of mean strength, for American troops serving in Alaska, Panama Canal Zone, and China, officers and enlisted men, for the year 1915.

74. Admissions to sick report, discharges, deaths, and noneffectiveness, with ratios per 1,000 of mean strength, for American troops serving in Hawaii, 1915, separately for officers, enlisted men, white, colored, and total.

75. Admissions to sick report, discharges, deaths, and noneffectiveness, with ratios per 1,000 of mean strength, for American troops serving on Army transports, officers, and native troops serving in Porto Rico, and for the Philippine Scouts, for year 1915.

76. Admissions to sick report, discharges, deaths, and noneffectiveness expressed in ratios per 1,000 of mean strength, for American troops (enlisted men) serving on duty at home stations placed in comparison with the same data for those serving at distant stations, year 1915.

77. (Foreign table not used this year.)

78. (Foreign table not used this year.)

79. Showing the most important diseases, by departments, in the United States (continental, excluding Alaska), officers and enlisted men, year 1915.

80. Comparative figures, Army, enlisted American troops, 1911–1915.

81. Admissions and cases compared, 1904–1911, inclusive.

TABLE NO. 66.—*Surgical operations performed by officers of the Medical Corps on officers and enlisted men of the Army during the calendar year 1915.*

Operation.	Disease or injury.	Cases.	Result.				Anesthetic.				
			Successful.	Partially successful.	Failure.	Died.	Chloroform.	Ether.	Chloroform and ether.	Other general anesthetic.	Local.

emoval of bone plate and excision of excessive callus.	Osteomyelitis chronic suppurative at site of screw in bone plate.	1	1					1				
uretment of bone and medulla.	Osteomyelitis tibia, site of fracture.	1	1				1					
xcision of anterior surface.	Osteomyelitis, middle third of tibia.	1	1					1				
xcision of terminal phalanx.	Osteomyelitis thumb	1	1					1				
uretment	Rarefying osteitis tibia	1	1					1				
xcision of periosteum, curetment of bone and drainage.	Osteoperiostitis tibia	1	1					1				
xcision of periosteum	Osteoperiostitis plastic, tubercle of tibia.	1	1					1				
cision, curetment, and drainage.	Osteoperiostitis tibia syphilitic.	1	1					1				
Do.	Osteoperiostitis, site not stated.	2	2					2				
Do. 1 cision and drainage. 3	Periostitis of tibia	4	2	2				3			1	
retment of periosteum and bone with drainage.	Periostitis suppurative fibula.	1	1				1					
Do. 6 cision and curetment. 1	Periostitis, site not stated.	7	7					3			3	1
cision	Exostosis, tibia	1	1					1				
Do.	Exostoses, os calcis	4	4					4				
Do.	Exostosis, scaphoid, foot	1	1					1				
Do.	Exostosis, first metatarsal.	1	1								1	
Do.	Exostosis, site not stated	6	6					5			1	
	JOINTS.											
hrotomy, removal of redundant capsule.	Dislocation chronic subcoracoid.	1	1					1				
psular ligament shortened by plication anterior route.	Recurrent dislocation shoulder.	1	1								1	
Do.	Subluxation shoulder	1	1					1				
ision and drainage	Arthritis elbow, gonorrheal	1	1					1				
duction and suture	Dislocation, acromio-clavicular.	1	1					1				
cision head of radius	Limitation of extension and rotation of elbow joint.	1	1					1				
moval	Foreign body elbow joint	3	3					2			1	
section	Recurrent dislocation finger.	1	1								1	
moval of callus	Ankylosis, thumb	1	1								1	
eing of adhesions	Ankylosis phalangeal joint	1	1					1				
ision and removal detached fragments.	Partially detached segments inner condyle of femur.	1	1					1				
ploration of joint. 1 ision and drainage. 1	Synovitis knee joint	2	2					2				
Do.	Arthritis, site not stated	2	2					2				
cision of villi	Synovitis chronic due to hypertrophied synovial villi.	1	1					1				
acentesis	Hydrarthrosis knee joint	1	1									1
piration	Hydrops articuli	1	1									1
Do.	Contusion knee joint	1	1					1				
cision	Post-patellar fringe	1	1					1				
section interphalangeal	Hammer toe	1	1					1				

TABLE NO. 66.—*Surgical operations performed by officers of the Medical Corps on officers and enlisted men of the Army during the calendar year 1915*—Continued.

Operation.	Disease or injury.	Cases.	Result.				Anesthetic.					
			Successful.	Partially successful.	Failure.	Died.	Chloroform.	Ether.	Chloroform and ether.	Other general anesthetic.	Local.	None.

TABLE No. 75.—*Admissions to sick report, discharges, deaths, and noneffectiveness, w ports, for officers and native troops serving in Porto Ri*

Serial Nos.	International classification.		Army transports, officers and enlisted men.							
		Mean strength	S. G. O., 1,385—A. G. O., 1,385.							
		Causes of admission to sick report.	Admissions.		Discharges.		Deaths.		Non-effective	
			Number.	Ratio.	Number.	Ratio.	Number.	Ratio.	Number.	Ratio
228-231	99b	Other diseases of the mouth and annexa								
232-236	100	Diseases of the pharynx	73	52.71					0.79	0
238	102	Ulcer of stomach							.16	
239-244	103	Other diseases of stomach (cancer excepted)	20	14.44					.47	
245-253	105	Diarrhea and enteritis	57	41.16					.76	
254	106	Ankylostomiasis								
255-259	107	Intestinal parasites	1	.72					.01	
260	108	Appendicitis	4	2.89					.27	
261-263	109	Hernia	1	.72			1	0.72	.33	
264-267	110a	Diseases of the anus and fecal fistula								
268-272	110b	Other diseases of the intestines	14	10.11					.79	
276	114	Biliary calculi	1	.72					.08	
277-281	115	Other diseases of liver and gall bladder	5	3.61					.27	
288	119	Acute nephritis	3	2.17					.11	
289-291	120	Bright's disease							.41	
293-299	122	Other diseases of the kidney and annexa							.08	
303-306	124	Diseases of the bladder	1	.72					.59	
304	124b	Enuresis							.59	
307-309	125	Diseases of the urethra, urinary abscess, etc							.00	
310-312	126	Diseases of the prostate							.08	
313-319	127	Diseases of the male genital organs (non-venereal)	4	2.89					.07	
322-323	143	Furuncle and carbuncle	3	2.17					.02	
324-325	144	Acute abscess and cellulitis	9	6.50					.34	
352-357	146	Diseases of the bones	3	2.17					.11	
358-360	147	Diseases of the joints							.65	
367	149g	Flat foot							4.13	
372	150	Congenital malformations	1	.72					.02	
375	189Aa	Febricula, simple continued, and other fevers of undetermined causation								
379	189Ba	Under observation, undiagnosed and unknown							.15	
		AFFECTIONS PRODUCED BY EXTERNAL CAUSES.[1]								
426-434	155-163	Suicides, all								
435	164	Poisoning by food								
436	165a	Venomous bites and stings								
437	165b	Other poisoning (deleterious gases excepted)								
438	166	Conflagration								
439	167	Burns (conflagrations excepted)	1	.72						
441	168a	Suffocation, strangulation								
442	169	Drowning, accidental					1	.72		
443	170	Traumatism by firearms (other than specified)								
445	171	Traumatism by cutting or piercing instruments	5	3.61						
446	172	Traumatism by fall	14	10.11						
448	174	Traumatism by machines	2	1.44						
449	175	Traumatism by other crushing	2	1.44						
450	176	Injuries by animals								
453	179	Effects of heat	1	.72						
456-458	182-4	Homicides, all								
459	185	Fractures, causes not specified								
460	186	Other external violence	9	6.50						
		Killed or wounded in action:								
462		By bullet								
463		By shell								

---

[1] Noneffectiveness for individual external causes not tabulated.

tios per 1,000 of mean strength, for officers and enlisted men serving on Army trans-
r native troops in Philippine Islands, year 1915—Continued.

Porto Rico, officers and enlisted native troops.								Philippine Islands, native troops.

TERNATIONAL MILITARY MEDICAL STATISTICS FOR THE YEAR 1915.

hese tables are those agreed upon at the International Commission
the Unification of the Medical Statistics of Armies, held at Buda-
t in 1894, at Madrid in 1903, and modified by the last meeting held
Berlin in 1907. They are calculated for the United States Army
per (white and colored) and include enlisted men only. Disposi-
s include cases remaining from last year. Deaths include suicides
accidents. Days lost include those lost this year by cases remaining
n last year.

able I shows in absolute numbers, by divisions, the mean strength
he command, the admissions to quarters, to hospital, and total
issions; the disposition of the sick, total, and the number returned
luty, died, and otherwise disposed of, and the total number of days'
ness.

Table II gives the same data in ratios per 1,000, and also shows days lost per soldier and per admission.

Table III shows, by arms of service, the mean strength, the t admissions, and those admitted to hospital only, the total dispositio and the number of those returned to duty, and the number that di

Table IV gives the same data as Table III by months.

Table V shows for each of the larger garrisons the mean streng admissions to hospital, total admissions, and the deaths.

Table VI shows for each of the 38 diseases or disease groups agr upon by the international commission, the number remaining un treatment at the commencement and close of the current year, admissions and dispositions for the year, the total sick days, and average number of days per case.

Table VII shows the admissions, by arms of service, for the disea and disease groups referred to in Table VI.

Table VIII shows the same data as Table VII by months.

Table IX shows deaths by rank, by length of service, and by a

Table X shows the same data as Table IX for discharges for physi disability.

INTERNATIONAL TABLE I.—*Movement of sick by Army corps (departments).*

ABSOLUTE NUMBERS (ENLISTED MEN).

nited States.—Military departments, United States, continental (excluding Alaska), showing the relative admission, discharge, and death rates for disease, officers and enlisted men, 1916 182

REPORT OF THE SURGEON GENERAL OF THE ARMY.

I have the honor to transmit herewith the annual report of the Surgeon General of the Army for the calendar year 1916, including a financial statement for the fiscal year 1916–17. This is the one-hundredth consecutive annual report of the Surgeon General, the first having been compiled in the year 1818. The century covered by these reports, extending approximately from the War of 1812 to the War of 1917, has been a period of remarkable scientific and professional advancement and of military and material achievement for our country in which the Medical Department and the Army of the United States have played a highly creditable if not a conspicuous part.

GEOGRAPHICAL DISTRIBUTION.

The wide geographical range and varied character of the activities of the medical officers of the Army during the past two decades have been a matter of frequent comment. The year 1916 proved no exception to the rule, and the Medical Corps found its field of action, not only in the various parts of continental United States, but also in Mexico, in Alaska, in Panama and Porto Rico, in Hawaii, in the Philippines, and in China. It may be stated in passing that recent events have further increased the regional distribution of our Army, and the Medical Corps now faces the sanitary and hygienic problems of a great modern war, staged with a European background, and under conditions unparalleled in the history of warfare.

The services rendered by the officers of the Medical Corps have been highly satisfactory in all respects, administrative as well as professional, and have entirely justified the commendation made by their superiors in official reports.

Special emphasis should be placed upon the excellent work accomplished by the medical officers of the Regular Army in connection with the expedition into Mexico, and particular attention should be directed to the exceptional results achieved in the Southern Department by the medical officers of both the Regular Army and the National Guard during the mobilization of the Army and the Guard on the border in the summer and fall of 1916.

The following senior medical officers of the Medical Corps, United States Army, have held positions of special importance during the year 1916:

Col. Henry P. Birmingham, Acting Surgeon General, United States Army, during the period of mobilization of the Regular Army and National Guard, June–December, 1916.

Col. William H. Arthur, commandant Army Medical School and Laboratories, Washington, D. C.

The department surgeons, commanding officers of general hospitals, officers in charge of Red Cross and special work and general supply depots, and the chief surgeons and sanitary inspectors of expeditionary forces were: Colonels of the Medical Corps Charle Richard, Rudolph G. Ebert, William H. Arthur, George E. Bushnell, Henry P. Birmingham, William O. Owen, William Stephenson, Guy L. Edie, William D. Crosby, Charles M. Gandy, Walte D. McCaw, Jefferson R. Kean, Henry I. Raymond, William F Kendall, William B. Banister, Charles F. Mason, James D. Glennan Alfred E. Bradley, Euclid B. Frick, Frank R. Keefer, Charles Wilcox, Thomas U. Raymond, Henry D. Snyder, Allen M. Smith Joseph T. Clark, Merritte W. Ireland, Henry C. Fisher, Henry A Shaw, Francis A. Winter, George D. Deshon, Champe C. McCullough, jr., Frederick P. Reynolds, Paul F. Straub, Alexander N Stark, Charles Lynch, Edward L. Munson, James M. Kennedy Deane C. Howard, William H. Wilson, William F. Lewis, Thomas S Bratton, Thomas J. Kirkpatrick, Irving W. Rand, Powell C. Fauntleroy, James S. Wilson, Basil H. Dutcher, Leigh A. Fuller, George A. Skinner, Carl R. Darnall, Henry Page, Bailey K. Ashford, Henry A. Webber, Jesse B. Clayton, Weston P. Chamberlain, Edward R Schreiner, Frederick M. Hartsock, Douglas F. Duval, and Clarence J. Manly.

THE GREAT WAR.

On the 6th of April, 1917, the United States entered as an active participant the European war, the most formidable military contest of all time, ancient or modern.

It is manifestly undesirable at this time to allude except in most general terms to the preparations made for this struggle by the War Department, or refer except briefly to the plans of the Medical Department for its very important part in the war, with its exacting responsibilities in connection with all that relates to the health, hygiene, and sanitation of the enormously increased military forces of the United States, included in the Regular Army, National Guard, and National Army.

The details of the important work mentioned and the medical history of the part taken by the United States in the great war will be properly a subject for future annual and special reports, and the means to secure this end have already been given careful consideration with the view that nothing of professional or historical value and interest may be lost.

As evidence of the unprecedented expansion of the activities of the Medical Department of the Army, it can be stated that at this time there are more than 13,900 officers engaged in the work of the Army Medical Department, including officers of the Regular Medical Corps, and the four Officers' Reserve Corps—Medical, Dental, Veterinary, and Sanitary—connected with the work under the direction of the Surgeon General of the Army.

It is believed that at least 24,000 physicians will be included in the personnel of the Medical Department of the Army when full strength is attained.

Every step in caring for the physical welfare of the enlisted men, officers, and civilians associated directly with the military organizations of the United States from the time of their entry into active service until they are discharged comes under the direction of the Medical Department of the Army.

In this work is included the physical and mental examination nd training of recruits, the supervision of the water supplies, the spection of foods to be served, the disposition of wastes, sanitaon of cantonments and camps, care of sick and wounded, includng proper records of all cases, the operation of field, base, and conlescent hospitals, reeducation of the permanently crippled and e handling of the necessary medical supplies and equipment for l this work.

The total number of hospital beds will be placed on a basis of 25 r cent of the strength of the Army.

In preparing for the great task devolving upon the Medical Department, as outlined above, this office is having the earnest and wholearted support of the entire medical profession of the United States, hich has responded promptly and placed at the disposition of the rgeon General of the Army the services of the most distinguished pecialists in all branches of medical endeavor.

These distinguished men of the medical profession enrolled as embers of the Council of National Defense, and as commissioned ficers of the Medical Reserve Corps, are rendering a service to the rmy and to the country which can not be overestimated and which ill ever be held in grateful remembrance.

GENERAL HEALTH OF THE ARMY.

The general health conditions of the United States Army for the lendar year 1916 were in all respects satisfactory and in view of e unusual circumstances connected with the mobilization on the order and the expedition into Mexico, may be fairly regarded as pecially creditable to those directly associated with the management all matters pertaining to the health and sanitation, particularly the troops serving in the Southern Department.

The mean strength (corrected for time) of the entire Army, Amerin and native troops, including the National Guard, was 176,803 for e year 1916. Its noneffective rate from all causes in the year was 4.26 per 1,000 and for disease alone, 20.55, both of which ratios ere slightly lower than for the previous year, 25.22 and 20.85, spectively.

The admission rate for the Army, including the National Guard, r 1916, was 858.87, as compared with 726.22 for 1915; the discharge te was 15.22, as compared with 14.06 for the previous year, and e death rate was 4.39, as against 4.45 per 1,000 of mean strength.

The mean strength of the entire Regular Army for the calendar ear 1916 upon which the statistics contained in the annual report re based, was 110,454.

The noneffective rate for the entire Regular Army for 1916, from ll causes, was 26.99 per 1,000 and for disease alone 22.63, being ightly higher than for the previous year, 25.22 and 20.85, respectely, but much lower than the average of these rates for the decade, 4.99 and 29.65, while that for the year 1906 was 47.86 per 1,000 om all causes.

The admission rate for the entire Army for 1916 was 726.45, as ompared with 726.19 per 1,000 for 1915.

The death rate of the entire Army for 1916, from all causes, was .19 per 1,000, compared with 4.45 for 1915, which was slightly higher than the lowest mortality rate in the Army for many year 4.40 for 1914. The death rate from disease was 2.71 per 1,000 f 1916, as compared with 2.53 for 1915; the average for the decade w 2.94 and for the year 1906, 3.77.

The discharge rate for the year 1916, from all causes, was 15. per 1,000 as against 14.06 for 1915 and 12.78 for 1914; while t rate for this year is slightly higher than for the two years previou it was less than the discharge rates prior to 1910 when they range from 16.64 upward.

The total losses of the Army from all causes—deaths, discharge and retirements—was 20.92 per 1,000 for 1916 and 18.03 per 1,00 for 1915; for the year 1914 the rate was 16.86, the lowest in the pa decade.

Malarial fevers show a noneffective rate of 0.62 for 1916, as co pared with 0.54 for 1915, the lowest noneffective rate in the histor of the Army. In 1906 the noneffective rate for malarial fevers alon was 2.55 per 1,000. The decade following has demonstrated th effectiveness of the antimalarial measures that have been unceas ingly employed by the sanitary officers of the Army each year, ex hibiting, with but two exceptions, a marked decrease in the incidenc of the disease.

The entire force in the Philippines, including native troops, gav an admission rate of 715.87 for 1916 as compared with 853.65 for th previous year, and noneffective rates, respectively, 23.27 and 24.72 This record is especially creditable, as compared with former years though here, as in the Canal Zone, the Medical Department has bee at some disadvantage, through lack of screening or other antimos quito requisites, due to insufficient appropriation of funds for thi important work. There should be no further delay in properl screening all buildings in the Tropics occupied as hospitals, barracks or quarters.

The highest noneffective rate, for disease alone, for 1916 wa among the troops stationed in China, 28.22 per 1,000. The rate i slightly lower than last year, when it was 31.78 per 1,000. Ther follows in order: United States with 25.51; Canal Zone with 23.45 Porto Rico with 22.53; Philippine Islands with 19.86; Hawaii wit 15.23; Mexico with 12.79; and Alaska had a rate of only 6.23, whic is slightly higher than that for last year, 6.02.

Typhoid fever.—Typhoid fever has always held an important plac in relation to the health and efficiency of armies. Its widesprea occurrence in civil communities has caused in the past its promp appearance among recently recruited levies of troops, especiall those of youthful age from rural districts.

The history of typhoid fever in the United States Army is now a matter of common knowledge. The ravages of the disease in the volunteer organizations encamped in the South during the summe and autumn of 1898, the year of the Spanish-American War, is wel remembered. Improved methods in camp sanitation, the specia care given to food and water supplies, and the disposal of refuse and excreta all contributed to the marked reduction in the incidence o typhoid fever among the Regular troops during the decade following the War with Spain.

It was not, however, until the introduction of vaccination against typhoid, a procedure made compulsory in the United States Army

1911, that this disease ceased to become a distinct menace in our rvice whenever any considerable body of troops were mobilized der the conditions usually prevailing in the field.

With the thorough vaccination of the Army, typhoid fever has peared only sporadically, usually less than a dozen or two cases a ar—this among troops serving in many climates and countries lfway round the world—in fact, has been regarded as a remarkable cord and unquestioned proof of the value of typhoid vaccination. ring the past year there were 96 cases of typhoid fever in the tire Army with 5 deaths resulting. Of this number 16 cases among gulars and 71 in the National Guard, a total of 87, occurred within e continental limits of the United States; of the 9 other cases, 7 re in Hawaii and 2 in Mexico.

The results following compulsory vaccination in the Army are now ll known and are exemplified by the record of the present year en compared with those for the year 1898 when the Army was erating under similar disadvantages.

The observations of competent observers have proved conclusively at the triple typhoid vaccine, adopted for immunizing the entire my against typhoid and paratyphoid fevers, gives as good results immunization as does the typhoid alone and that neither the genal nor local reactions following its injection are different in any degree om those occurring after the inoculation of simple typhoid vaccine.

The results, both from a practical and theoretical point of view, e all in favor of combining the three organisms in a single vaccine, d it is believed amply justify the use of the triple typhoid vaccine immunizing our troops against the typhoid and paratyphoid fevers.

Paratyphoid fever.—Paratyphoid fever had been but little known and rely diagnosed and reported in our military service prior to the ar 1916. Many such cases had undoubtedly been reported as vers of undetermined causation.

There were 410 cases of this disease reported in the entire Army—4 for Regulars and 296 for the National Guard.

During the mobilization of the Regular Army and National Guard the Mexican border and during the expedition into Northern exico, paratyphoid fever was recognized quite frequently, and in o forms caused by distinct bacilli known as paratyphoid "A" and ratyphoid "B," the former being the causative agent in the very rge proportion of cases.

Vaccination against the disease was rigorously instituted by the ting Surgeon General with the result that several outbreaks of the sease in the Southern Department were immediately checked, all oops in the infected divisions being fully immunized against the sease. There were 410 cases of paratyphoid fever reported, 2.32 r 1,000 of mean strength, of which over 95 per cent were of the "A" pe. These cases were distributed as follows: The Regular Army rnished 114 cases, of which number 22 occurred in the United ates, 91 in Mexico, and 1 in China. The National Guard had 296 ses which, with the 22 for Regulars, made 318 in the year for the nited States.

Vaccination against both typhoid and paratyphoid fever is now complished by the use of a mixed vaccine, recently adopted and own as "The Triple Vaccine" from the fact that it is made from the bacillus typhosus, the bacillus paratyphosus A, and bacil typhosus B.

This vaccine prepared, as have been all the Government vaccir in the past few years, in the laboratories of the Army Medical Scho Washington, D. C., is given in a single series of three doses, the fi containing ½ c. c. and second and third doses 1 c. c. each, with interval of approximately 10 days between each administration.

Malarial fevers.—As in previous years, this disease shows a mark decrease throughout the Army, with the possible exception of certa of the garrisons in the Philippine Islands situated in malarious d tricts, and with many carriers among the local native populatio The admission rate in 1916 for this disease in the entire Regular Arn was 23.61, slightly lower than for the previous year, when it was 25. per 1,000 of mean strength. The noneffective rate was 0.62 as again 0.54 for the previous year. The National Guard had a case rate 31.50 with 0.64 noneffective per 1,000 of mean strength.

Measles.—Regular troops serving in the United States (continenta year 1916 furnished 1,247 cases of measles and 9 deaths, propo tionately 19.35 and 0.14 per 1,000 of mean strength, as compar with 12.86 and 0.14 for the National Guard. The entire Arm Regulars and National Guard, all stations, home and abroad, ha 2,168 cases and 18 deaths, respectively, 12.24 and 0.10 per 1,000 strength. The rates for Regulars in 1915 were, respectively, 8. and 0.29.

The recruit depots, particularly at Columbus Barracks and Jeffers Barracks, Mo., were frequently overcrowded during the winter ar early spring months, with the result that has invariably attend such congestion. Many cases of measles occurred, chiefly among t highly susceptible material from the southern rural districts, t cases not infrequently being complicated with middle ear disease- empyema and broncho-pneumonia; all were very serious complic tions, particularly the latter, and as in civil life resulted fatally in considerable number of instances.

In this connection it is a timely thing to again utter the earnes warning against the overcrowding of troops, particularly recruits an fresh levies in their tents, camps, barracks, and cantonments.

Overcrowding and close contact of the well with the sick in th early stages of illness is the prime cause in rapid spread of practicall every disease, but more especially is this true of those affecting th naso-pharynx and the respiratory system, including tuberculosis measles, mumps, scarlet fever, pneumonia, and epidemic meningitis

The occurrence of measles in epidemic form among certain organizations in camp on the Mexican border gave an opportunity for competent observers to investigate the disease under the conditions obtaining in the field and led to the conclusion of a well-known authorit that not only are measles epidemics preventable, but that in th future they should be prevented not only in the field but also in barracks and recruit depots, the result being assured, if proper ventilatio and other facilities are provided and attention given to the important matter of the prevention of overcrowding; to the prompt isolation of contacts, and to the careful segregation of the nonimmune all under rigid and repeated inspections by trained medical officers

Tuberculosis.—Pulmonary tuberculosis continues to hold a ver important position among the cause for disability discharge from th rmy, and the desirability of early recognition of the disease, par- ularly at recruit stations and depots in applicants for enlistment, at once apparent,and the matter has been given careful considera- on.

As at present provided, all candidates for the military service will given not only the usual strict physical examination always re- ired under the existing regulations but will be further brought ider the observation of a special board of experts chosen from e distinguished clinicians of the Medical and Medical Reserve rps of the Army. The duties of these special examiners are most iportant and are included under the following general heads:) To exclude cases of manifest tuberculosis from the Army; (2) to ld to service men who allege tuberculosis as a ground for exemp- n under the selective draft, or discharge on the basis of insufficient incorrectly interpreted signs and symptoms; (3) to determine in ses of soldiers accepted for the military service the existence of ulmonary tuberculosis and to decide whether or not the disease s been incurred in the line of duty. Definite and explicit instruc- ons to govern these examiners have been prepared and issued by is office.

Venereal disease.—It has often been assumed by well-meaning but -informed critics that illicit sexual intercourse and venereal dis- ses are more common in the military forces of the United States han in civil life.

That this is an erroneous conclusion is well known to most of the edical practitioners of the country, and one resulting principally om the fact that the statistics of these diseases are collected by the irgeon General of the Army and frankly published, whereas the rresponding figures for civilian life are incomplete and inaccessible.

Recent legislation giving to the Secretary of War and the military mmanders authority to control not only, as heretofore, the mili- ry reservations and cantonments, but also the civil communi- es immediately adjacent, in all matters relating to prostitution and e sale of alcoholic drinks, will do much to bring about the desirable nditions long sought for by the Army sanitarian.

It should be repeated that venereal diseases have never had their rigin in military reservations, where strict discipline and constant spections have rendered it impossible, but rather in the laxly overned civil communities surrounding many Army posts, where norance of conditions and indifference, or something even worse on e part of local authorities, have conduced to widespread infection, ot only of the civil population but the soldiery as well.

The law referred to, which marks such a great step forward in the atter of military sanitation and hygiene in our country, was pro- ulgated May 24, 1917, as sections 12 and 13 of Bulletin No. 32, Var Department, as follows:

Sec. 12. That the President of the United States, as Commander in Chief of the rmy, is authorized to make such regulations governing the prohibition of alcoholic quors in or near military camps and to the officers and enlisted men of the Army s he may from time to time deem necessary or advisable: *Provided*, That no person, rporation, partnership, or association shall sell, supply, or have in his or its posses- on any intoxicating or spirituous liquors at any military station, cantonment, camp, rt, post, officers' or enlisted men's club, which is being used at the time for military urposes under this act, but the Secretary of War may make regulations permitting the sale and use of intoxicating liquors for medicinal purposes. It shall be unlawf to sell any intoxicating liquor, including beer, ale, or wine, to any officer or memb of the military forces while in uniform, except as herein provided. Any perso corporation, partnership, or association violating the provisions of this section or t regulations made thereunder shall, unless otherwise punishable under the Articl of War, be deemed guilty of a misdemeanor and be punished by a fine of not mo than $1,000 or imprisonment for not more than 12 months, or both.

SEC. 13. That the Secretary of War is hereby authorized, empowered, and direct during the present war to do everything by him deemed necessary to suppress ar prevent the keeping or setting up of houses of ill fame, brothels, or bawdy houses with such distance as he may deem needful of any military camp, station, fort, post, ca tonment, training or mobilization place; and any person, corporation, partnershi or association receiving or permitting to be received for immoral purposes any pe son into any place, structure, or building used for the purpose of lewdness, assignatio or prostitution within such distance of said places as may be designated, or shall pe mit any such person to remain for immoral purposes in any such place, structur or building as aforesaid, or who shall violate any order, rule, or regulation issued carry out the object and purpose of this section shall, unless otherwise punishab under the Articles of War, be deemed guilty of a misdemeanor and be punished by fine of not more than $1,000 or imprisonment for not more than 12 months, or bot

VACCINATION IN THE ARMY.

The subject of vaccination against smallpox, typhoid, and paraty phoid fevers is one concerning which this office has received man inquiries.

It may be stated here that the question of vaccination against th three diseases mentioned above has been considered by both the lin and staff many times in the history of the Army, particularly wit reference to vaccinations against smallpox, with the result that Wa Department orders have always required compulsory vaccinatio against smallpox.

In this connection the experience of the French in the Franco Prussian War should be remembered. In 1870 one of the wors epidemics of smallpox of recent times spread throughout Europe largely due to the movement of troops. This epidemic did not ceas until after 1873, when peace conditions again prevailed.

The Germans were fairly well vaccinated, for, while there was n revaccination law, those entering the army were always vaccinated while in France vaccination was very poorly practiced.

As a result, there were not only more cases in the French Army but they were of a more malignant type. Therefore, the absolut mortality was 50 times greater in France than in Germany and th rates of deaths to the number of cases nearly twice as large.

Vaccination (inoculation) against typhoid fever was a direct out growth of the disastrous epidemics of typhoid in our camps durin the Spanish-American War. The commission which investigate this notable epidemic (Majors Reed, Vaughan, and Shakespeare) demonstrated that one-fifth of the soldiers in the national encamp ments had typhoid fever. Among 107,973 men there were 20,73 cases and 1,580 deaths.

The experience of the British in South Africa was equally deplorable.

Antityphoid vaccination protects us against similar disasters an is the only method which protects under war conditions.

Voluntary antityphoid vaccination was begun in the Unite States Army in 1909 and continued until the mobilization at Sa Antonio, Tex., in March, 1911. Since that time it has been compuly in the military service. Full protection of the Army against hoid was not obtained in the Army until the vaccination was de compulsory.

he sanitary and military necessity for compulsory vaccination inst smallpox, typhoid, and paratyphoid in every person asso-ed closely with the military forces of the country has been clearly l forcibly demonstrated. No exceptions should be made: every cer, enlisted man, and civilian employee should be fully immunized, as can be readily understood, an unprotected individual is a nace, not only to himself but to the whole command with which is associated.

SPECIAL DISEASES.

n view of the increasing importance to the military service of ntal diseases—diseases of the cardio-vascular system and orthope-s—particularly in relation to recruiting of new levies, the Surgeon neral has called to the assistance of the experts of the Regular dical Corps, as consultants, eminent members of the Medical serve Corps skilled in these specialties, who will be assigned to the ge military stations for duty as occasion may require.

hey will act either as members of the medical staff of the organi-ion, with more or less permanent assignment to it, or in certain ses they may visit a command for a temporary service to act as nsultants with the camp surgeon or to give instruction in their ecialties to the medical officers on regular duty with the troops.

HOOKWORM DISEASE.

Several regiments recruited from the rural districts and small towns the Southern States have been subjected to special investigation experts of the Medical Corps to determine the frequency of hook-rm infection. The results are such as to demonstrate clearly the sdom of making a routine examination of all recruits entering the vice from certain geographical regions, as is now being done.

It has been shown, for example, that three regiments from different ates of the South, consisting of approximately 3,400 men, con-ned individuals infected with hookworm, the percentages of those rboring the parasite being reported as 6, 32, and 54 per cent of the tal strength of the organizations.

The American hookworm (necator Americanus) is prevalent nearly erywhere in the Southern States and has been frequently found our island possessions. The freeing of the population in Porto co from this demoralizing pest constitutes one of the most valuable eces of scientific and economic work ever accomplished by a medical ficer of the Army. More recently members of the Medical Corps, rving with commissions appointed for the purpose of investigating e hookworm problem in the United States, have rendered important ports and contributed much to the general knowledge of the subject this country.

LOBAR PNEUMONIA.

This disease, always an important one and heading the mortality t of acute diseases in both military and civil life, prevailed in a arked degree among certain organizations in the Southern Department during the winter and early spring months of 1916–17. T localized epidemics were given careful study by special medi officers detailed for that purpose, and their valuable reports ha already been published and widely read.

It has been demonstrated that if camps are maintained during t winter months epidemic lobar pneumonia must be given seric consideration by the military sanitarians, a fact recently shown n only by our experience but also by the reports from the arm abroad.

So that in addition to our labors against the other diseases, wh infection is acquired through the nasopharynx, such as measl mumps, diphtheria, and meningitis, we must now give renewed a most extraordinary attention to our precautions against "tl greatest of all the captains of the men of death."

Epidemic lobar pneumonia may be expected in the great cam during the winter months as a result of infection by a pneumococc occurring in two principal types. Evidence at hand indicates th tent, company, and regimental contagion is probable. Serum tre ment has produced excellent results in keeping down mortalit while vaccination is considered quite as valuable a measure of pr vention as isolation. A combined pneumococcus and meningococc vaccine has been strongly urged for immunizing a command wh the action is indicated by the character of the epidemic.

THE ARMY MEDICAL SCHOOL.

The Army Medical School, now located at 462 Louisiana Aven NW., Washington, D. C., has had the most important and successf year in its history and has experienced a development and expansic quite beyond the thought and purpose of its founders. The wi scope of its present activities and the very important work it h accomplished during the past 12 months, not only for the Army b also for the other branches of the military service, is clearly set for in the report of Col. William H. Arthur, Medical Corps, who as tl commandant of the school since October, 1915, with the aid of a efficient corps of assistants, has produced the splendid and far-reacl ing results already mentioned and now generally appreciated througl out the country. Attention is invited specially to the statement the Army Medical School which appears in the following pages.

In the report of last year referring to the school it was state that its importance to the military service could hardly be ove estimated and recommended that steps be taken looking to the se curing by the Government of a suitable modern building speciall designed for its purposes.

Heretofore its activities have been in no small degree handicappe by crowded or imperfectly arranged rented buildings, and while it present quarters are much better adapted to the uses of the schoo than any of its former homes, yet they are far from ideal in arrang ment, size, and location and leave much to be desired.

The Army Medical School having now demonstrated fully its grea sphere of usefulness in both scientific and utilitarian lines, th Government should no longer hesitate in providing it a permanen and modern home of its own—one that might quite possibly wit advantage be made sufficiently large to house also the library of th Surgeon General and the museum.

THE SURGEON GENERAL'S LIBRARY.

The reports of the Surgeon General of the Army have contained in ties past references and recommendations relating to the great and ique collection of medical literature now contained in the building at th corner of Seventh and B Streets SW., this city.

The importance of this library of the Surgeon General as it is own to the Army and to the medical profession of the country is ll recognized by the entire scientific world, but the fact that it is now used in a building obsolete, crowded, and nonfireproof does not pear to be so generally known nor to have attracted the immediate ention that the subject deserves.

As has been previously stated, the library of the Surgeon General the Army began as a small collection of books in the office of rg. Gen. Lovell in 1835, numbering about 228 volumes in 1840 d increased to about 587 in 1862.

The library in 1865 came first under the master hand of John aw Billings, and to this able medical officer and distinguished liographer must be given the greatest credit for several unique tures in connection with its development. In 1889 the collection nsisted of about 1,000 volumes. In 1895 it had grown under the ministration of Capt. Billings to 300,000 portraits, books, and mphlets. During this period the librarian conceived and promptly itiated the ingenious plan of a medical catalogue, indexed for thor and subject, that should embrace not only monographs and andard works but also the reports of individual cases, upon which many conclusions of medical science depend.

From this beginning has developed the Universal Catalogue of edical Literature. The Index Catalogue, the first volume of hich was issued in 1880, consisted of 880 quarto pages. Since that ate at least one such issue has been made annually by him and his ble successors, Billings himself having edited the entire first 16 olumes, which ran through the alphabet.

This Index Catalogue, requiring great technical knowledge, inllible arrangement, and unceasing industry, has been kept fully up date, and to the latest professional advances, and, making its way er the earth wherever medical science is known, has brought great edit to the Army and fame to its designer and compilers, and has ceived the high commendation of the whole world, praise not ven to mediocre work.

The Surgeon General's library on June 30, 1917, contained bound olumes, theses, journals, transactions, unbound volumes, and pamhlets, constituting the largest and doubtless the most valuable colction of medical literature in the world.

The Army Medical Museum is now located in the same building the Surgeon General's library and has developed during the past alf century in close connection with it.

The museum had its inception under the direction of Surg. Gen. William A. Hammond in 1862. It began very simply, as all the reat collections have, but with the passing years under the skilled irection of many capable and devoted hands it has developed into ne of the largest, most instructive, and valuable museums in existence. It consists now of approximately 47,681 specimens, pathological, natomical, comparative anatomy, microscopical, and miscellaneous, and about 15,000 photographs and negatives. Approximately 8,0 specimens have been received through donation or secured by e change with other institutions.

The Surgeon General desires at this time to urge most earnes that an appropriation be made at once by Congress for the erecti of a suitable building to contain these two remarkable collections the Surgeon General's library and the Army Medical Museu They constitute one of the Nation's most valued assets and a treasu of inestimable worth to the medical profession and to scientific m and scholars of this and other countries.

There should be no delay in erecting in some central spot in o Capital City a modern, fireproof structure, adequate in every respe to house for all time in safety what is justly considered to be t most useful as well as the most extensive collection relating to me cine and science ever achieved.

MEDICO-MILITARY OBSERVERS.

The outbreak of the great war in August, 1914, found seve officers of the Medical Department of the United States Army Europe. They were promptly detailed and accredited as observe with the several combatant armies. Others were sent over by t War Department in 1915 and later, in May, 1916, several experience and specially qualified officers of the Medical Corps were detail upon recommendation of the Surgeon General for duty with t British and French forces on the western battle front.

The excellent work accomplished by all these officers since the arrival in Europe has been a matter of great assistance to the W Department and of particular advantage and satisfaction to th Medical Corps.

The wisdom of having medical officers with the European armi was early recognized and the only regret, now that the United State has since April, 1917, been an active participant in the great strugg is that more of them could not have been spared for duty abroa in the early months of the war.

The courtesies and privileges extended to the representatives the Medical Corps of the United States Army in Europe have bee greatly appreciated by the officers themselves and by the Surgeo General and the authorities of the War Department. As a furthe evidence of the good will and cooperation that now exists betwee the medical services of the allied forces, distinguished and high experienced medical officers of the British and French Armies hav been sent by their Governments as aides and consultants on th staff of the Surgeon General of the Army at Washington. Th value of the assistance they are so efficiently and cheerfully renderin the United States Medical Department can not be too strongl emphasized and commended.

ARMY NURSE CORPS.

The mobilization of the regular troops and militia on the Mexica border having resulted in the establishment of many hospitals a which nurses were needed, an addition of 276 nurses was authorize early in the year to meet the emergency. Nurses were appointe the regular corps as rapidly as possible and their number was rther augmented by the assignment of a large number from the serve, the enrolled nurses of the American Red Cross constituting he reserve. During the year nurses were sent to the following laces:

Base Hospital No. 1, Fort Sam Houston, Tex.
Base Hospital No. 2, Fort Bliss, Tex.
Base Hospital No. 3, Brownsville, Tex.
Base Hospital No. 4, Eagle Pass, Tex.
Base Hospital No. 5, Nogales, Ariz.
Camp hospital, Deming, N. Mex.
Camp hospital, Douglas, Ariz.
Camp hospital, Laredo, Tex.
Camp hospital, McAllen, Tex.
Camp hospital, Marfa, Tex.
Cantonment hospital, Columbus, N. Mex.

nd to the hospital train which has its headquarters at Camp Wilson, Tex. With the withdrawal of the troops the work at these laces gradually decreased and nurses were withdrawn from Columus, Llano Grande, McAllen, early in the year and later on from Marfa and Deming.

The Mexican Expedition.

The military expedition into northern Mexico, beginning in March, 916, and covering a period of nearly a year, presented many unusual eatures from the standpoint of the medical officer and in certain espects was unique.

Detailed reports from the surgeons assigned to the various organizations of the expedition have been received, and when opportunity presents will be given the full treatment they deserve in the form of a special bulletin. The most important features, however, are covered by the chief surgeons of the expeditionary forces in their reports presented in the following pages.

It may be here repeated that this force, consisting of United States troops of all branches of the service, crossed the Rio Grande River in early March, 1916, and entered the Province of Chihuahua, northern Mexico, in pursuit of bands of raiding outlaws, who had repeatedly disturbed the peaceful towns and settlements on the Texas border by unprovoked attacks.

The United States expeditionary force during most of its service consisted approximately of 12,000 men, divided into many detachments of varying size, distributed along an attenuated line of communication which reached several hundred miles southward from the base, established on the Rio Grande.

These troops conducted active and successful military operations in an arid, almost desert country, on a far extended line, under the most trying climatic conditions and with a restriction of food, clothing, and shelter quite unparalleled in the history of the United States Army when the length of service is considered.

During all of this arduous service the troops were maintained in an exceptional condition of health and efficiency. The noneffective rates compared favorably with those of the organizations serving in the home stations under garrison conditions.

The service of the Medical Department was thoroughly efficie and met all the unusual demands upon it in a manner to call fort the unqualified commendation of the commanding general of th expedition. The medical officers and the enlisted men of the Medic Department with the Mexican expedition of 1916 deserve to th fullest degree the praise bestowed upon them officially by the military associates and superiors.

THE MOBILIZATION OF THE REGULAR ARMY AND NATIONAL GUARD.

The concentration of practically the entire Regular Army an the National Guard in the Southern Department during the las six months of 1916 gave very exceptional opportunities for th instruction of troops in all matters relating to personal hygiene an in the sanitary precautions necessary to insure the health and comfort of soldiers in camp and on the march.

Generally speaking it may be said that the measures carried ou differed but slightly from those so successfully used in the past fe years by the Regular Army in other parts of the world. The stric attention to food and water supplies, to the careful disposal of wast materials of all kinds, coupled with vaccination against enteri diseases and the unceasing and vigilant scrutiny of trained sanitar inspectors, produced the satisfactory results that invariably follow such procedures. The general health of all the troops, as has bee said, was excellent. Sporadic outbreaks of communicable diseases were promptly checked and the physical vigor and the military efficiency of the various organizations at the close of the year was a matter of frequent comment and a subject of congratulation for al concerned, the National Guard proving themselves apt pupils equaling as a rule and frequently excelling the Regular troops with whom they were closely associated in maintaining an exceptionally low sick rate.

THE MILITARY SURGEON AND MEDICAL PRESS.

A large number of professional monographs and special reports, containing valuable information of scientific and military value to the officers of the service, have been received during the past year by the Surgeon General and have been appreciated and utilized so far as was practicable by this office.

The publication and prompt circulation of many of these important papers seemed highly desirable and to this end the medical press of the country has used its extensive facilities most freely and willingly to the very great advantage of the profession and the service.

The various journals of the country have contributed their share in forwarding this good work of education and have secured a publicity not otherwise obtainable at this time through the strictly official bulletins and reports of the year.

Particular attention in this connection is invited to "The Military Surgeon," the journal of the Association of Military Surgeons of the United States, which has rendered an exceptionally valuable service under the efficient direction of the associate editor, Col. John Van R Hoff, Medical Corps, retired.

HEALTH OF THE ARMY.

INTERNATIONAL NOMENCLATURE.

The diagnostic terms for diseases and injuries, adopted by the dical Department in accordance with the International Nomen- ture, are used with the international numbers for the fifth year in s report.

The International Nomenclature is used by most of the important eign countries. It is also used by the Census Bureau in this untry and by an increasing number of boards of health and large spitals.

In studying statistics for other countries, where the terms used are pressed in a foreign language, the international number furnishes eady key for their interpretation.

Following Table No. 81 will be found the 10 tables giving the litary statistics for the year 1916, as agreed upon at the Inter- tional Commission for the Unification of the Medical Statistics of mies, held at Budapest in 1894, at Madrid in 1903, and modified the last meeting held in Berlin in 1907. The diagnostic terms and mbers used in these tables are those agreed upon by the commis- n and are not to be confused with the terms and numbers of the ternational nomenclature used in the remainder of this report and sed upon the second decennial revision by the international com- ission held in Paris, July 1 to 3, 1909.

As in 1912, 1913, 1914, and 1915, only original admissions are used compiling the statistics in this report. In the years 1904 to 1911, clusive (reports 1905–1912), the readmissions were counted as dmissions. In this report in making comparisons between cases and dmissions the terms case admission (reports 1913–1916, inclusive, d prior to the one for 1905) and total admission (reports 1905–1912, clusive) will be used.

ADMISSION RATES.

Table No. 81 shows the total admission and case admission rates r American troops of the Army, for the United States, continental xclusive of Alaska), and for American troops in the Philippine lands for disease, external causes, and all causes separately for each ar 1904 to 1911, inclusive.

Table No. 68½ gives the rates per 1,000 for the entire Army. So uch interest has been displayed regarding the incidence of certain seases, especially tuberculosis, typhoid fever, and venereal dis- ses, for the entire Army—that is, for all officers and enlisted men, th American and native troops—that it was deemed advisable to blish this data to include all troops together. The rates for merican troops, enlisted men, placed in comparison for ready ref- ence, may be found in Tables No. 69 and 76.

OFFICERS.

The mean strength of officers was 4,734, as obtained from the ports of sick and wounded of the Medical Department, and 5,155 om the office of The Adjutant General. There were 2,408 admis- ons, 40 deaths, and 110.98 constantly noneffective from all causes, equal to ratios of 508.66, 7.76, and 23.44, as compared with ratios 553.03, 3.69, and 23.57 per 1,000 for the year 1915. The constant noneffective rate was higher than for 1915; the admission was lowe

The chief causes of admission and their rates were: Diarrhea ar enteritis, 57.24 for 1916, as against 39.14 for 1915; influenza, 51. as against 60.54 for 1915; diseases of the pharynx, 30.84 as again 31.63 for 1915; bronchitis, 29.57 as against 42.33 for 1915; diseas of the nasal fossæ, 24.29 as against 29.59 for 1915; and dengue, 11.4 as against 20.94 for 1915.

OFFICERS RETIRED.

Forty-five officers were retired on account of disability during tl year, making a rate for retirement for disability of 8.73 per 1,000, compared with 3.69 per 1,000 for 1915. The discharge rate for di ability in enlisted men (all) was 15.98, as compared with 14.06 p 1,000 for 1915.

The following table shows the principal causes for which retir ments were made and the rank and age of the officers retired:

TABLE NO. 1.—*Retirement of officers, United States Army, year 1916, for disabilit by causes and rank, grouped by ages.*

	Total.		Ages of officers, quinquennial groups.								
	Number.	Ratio per 1,000 of all officers.	24 years and under.	25 to 29 years.	30 to 34 years.	35 to 39 years.	40 to 44 years.	45 to 49 years.	50 to 54 years.	55 to 59 years.	60 yea an ove

NOTE.—Three deaths reported on this table occurred at private hospitals and were not included in general tatistics.

ENLISTED MEN.

The mean enlisted strength of the Army, American troops, white and colored, for the year 1916, as reported on the monthly sick reports of the Medical Department and on the returns of The Adjutant General's Office, was 99,186. There was an increase in strength over the year 1915, for which the medical returns showed 93,262 and The Adjutant General's Office 94,729.

During the year 1916 American troops were stationed in the United States proper, the Philippine Islands, China, Alaska, Hawaii, Canal Zone, and Mexico. Native troops served in Porto Rico and the

Philippine Islands. Statistics for the native troops—Porto Rican and the Philippine Scouts—have been separately compiled, and whe reference is made to the "Army" in this report the entire Regula Army—officers, white, colored, and native enlisted men—is mean

The size of garrisons in the Tropics, which constituted such a larg percentage of our military forces, renders of more importance tha formerly the general rates for the entire Army.

Charts A, B, C, D, E, F, and G are for the entire Army for th decade 1906-1916. For years prior to 1906 the same data as show in these charts will be found published in the report for 1912, page 14, 15, and 16.

Table No. 76 gives American troops, enlisted men by countrie placed in comparison for 1916.

The admission and noneffective rates for the entire Army and fo the troops in geographical divisions are readily comparable in the following tabulation:

Admission and noneffective rates for Regular Army entire and for troops in geographica divisions for years 1916 and 1915.

	Army (entire).	American troops of the Army (enlisted men).	Enlisted men serving in geographical divisions.								
			United States (at home).	Mexican punitive expedition.	Alaska.	Canal Zone.	Hawaii.	Philippine Islands.		China.	Porto Rico.
								American troops.	Native troops.		
Admission rates:											
1916	726.45	747.59	745.38	810.16	344.97	849.63	514.51	838.60	482.17	890.24	1,037.7
1915	726.19	744.59	704.01	....	386.63	871.00	568.94	990.45	573.84	1,462.17	555.0
Noneffective rates:											
1916	26.99	27.98	30.67	15.62	9.23	28.15	19.22	27.88	14.58	31.31	25.3
1915	25.22	25.88	25.74	....	8.91	26.00	20.44	29.15	15.68	35.00	22.7

The rates are slightly higher this year for the United States and Porto Rico. A decided reduction in admission and noneffective rates occurred in Alaska, Canal Zone, and the Philippine Islands, American and native troops. The most marked reduction is noted in the admission rate and in the noneffective rate for the troops serving in China.

ADMISSION TO SICK REPORT (AMERICAN TROOPS, ENLISTED MEN).

[See Tables Nos. 69 and 76.]

The admissions to sick report during the year 1916 show a slight increase, being 747.59 as compared with 744.59 in 1915. The admission rate for disease only is 619.22; in 1915 it was 610.32. Table No. 81 shows the case admission and total admission rates for all American troops, those in the United States and those in the Philippine Islands, 1904 to 1911, inclusive. The diseases causing the highest admission rates in 1916 were: Venereal, 103.35; diseases of the pharynx, 56.46; diarrhea and enteritis 49.81; bronchitis, 33.88; and influenza, 29.04. The rates just given are for the American enlisted men of the Army and are given first for convenience of comparison. For the entire Army (all officers and enlisted men, including native troops) the ad-ission rate is 726.45. For disease only the rate is 604.04, being ghtly higher both among the American troops and for the entire rmy. This is probably accounted for by the increased rates for arrhea and enteritis.

For venereal diseases the rate for white troops was 100.75, a decrease ver 1915; for colored, 147.10, which was slightly higher than for 915. The rates in the Philippines for these troops were 155.91 and 46.56, respectively, which are lower for both races over the rates of 915 in the Philippines, 177.08 and 258.76, respectively. These high tes are undoubtedly due to social conditions and indicate the ecessity for a change of conditions before rates comparable to those btaining in the United States may be expected. As the rate for 912 for colored troops in the Philippines was 524.06, the highest ecorded in the Army, the present rate is an index of the effectiveness f the measures instituted for improvement in this condition.

The case admission rate for external causes, American troops, ensted men, 1916, was 128.36. In 1915 this rate was 134.27, and in 914, 126.37. The principal causes for this rate were: Traumatism y fall, 30.89; traumatism by cutting or other piercing instruments, 2.65; injuries by animals, 11.38; traumatism by crushing, 8.87; traumatism by firearms, 3.90; burns, 3.56; and poisoning by food, 2.49.

NONEFFECTIVE RATES.

Chart B shows for the entire Army the constantly noneffective rate or all causes from the year 1907 to 1916, inclusive. This rate is the rue measure of noneficiency of the Army from sickness and injury. The rate for disease and injury obtained for the total American troops, nlisted men, for the year 1916 was 27.98, as compared with 25.88 for 915 and 24.02 per 1,000 in 1914. The rate for 1914 is the lowest ecorded noneffective rate in the history of the Army. The highest oneffective rate on record was for the year 1898, when the total rate was 82.83 per 1,000, and the rate for diseases alone was 69.09.

The noneffective rate for all troops in the military service, or the ntire Army, from all causes, was 26.99 (for disease alone, 22.63), which is slightly higher than that for 1915, but still much below the ates for any preceding year, except 1914, when the rate was 23.78. This rate during the past decade shows a steady reduction. In 1906 he noneffective rate was 47.86.

DISCHARGES FOR DISABILITY.

Chart D gives the rates for discharged for disability for the Army rom the year 1907 to 1916, inclusive.

Soldiers stationed outside of the territorial limits of the United States are brought to the United States for discharge, except those belonging to the Porto Rican Regiment and the Philippine Scouts. They are, however, credited in the tabulated reports to the country n which the soldiers were serving when they became disabled, if heir commands were there at date of discharge.

The present system requires that all soldiers certified by medical fficers to be permanently incapacitated for the military service hall be critically examined by a board of two medical officers before

Chart A.—Army. Officers and American and native troops.

* Excess of cases deducted to correspond with years preceding 1906, and 1912 to 1916.

Chart B.—Army. Officers and American and native troops.

[Noneffective rates, all causes, years 1906–1916.]

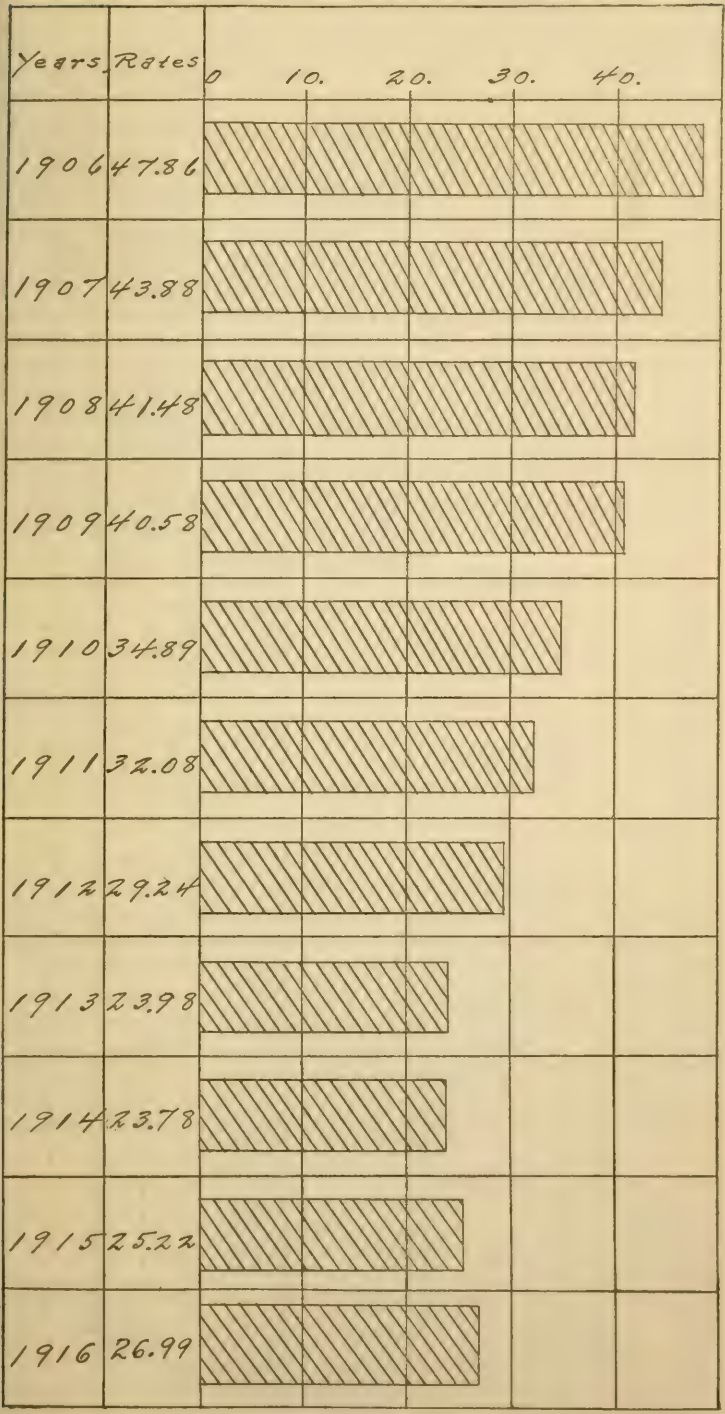

Chart C.—Army. Officers and American and native troops.

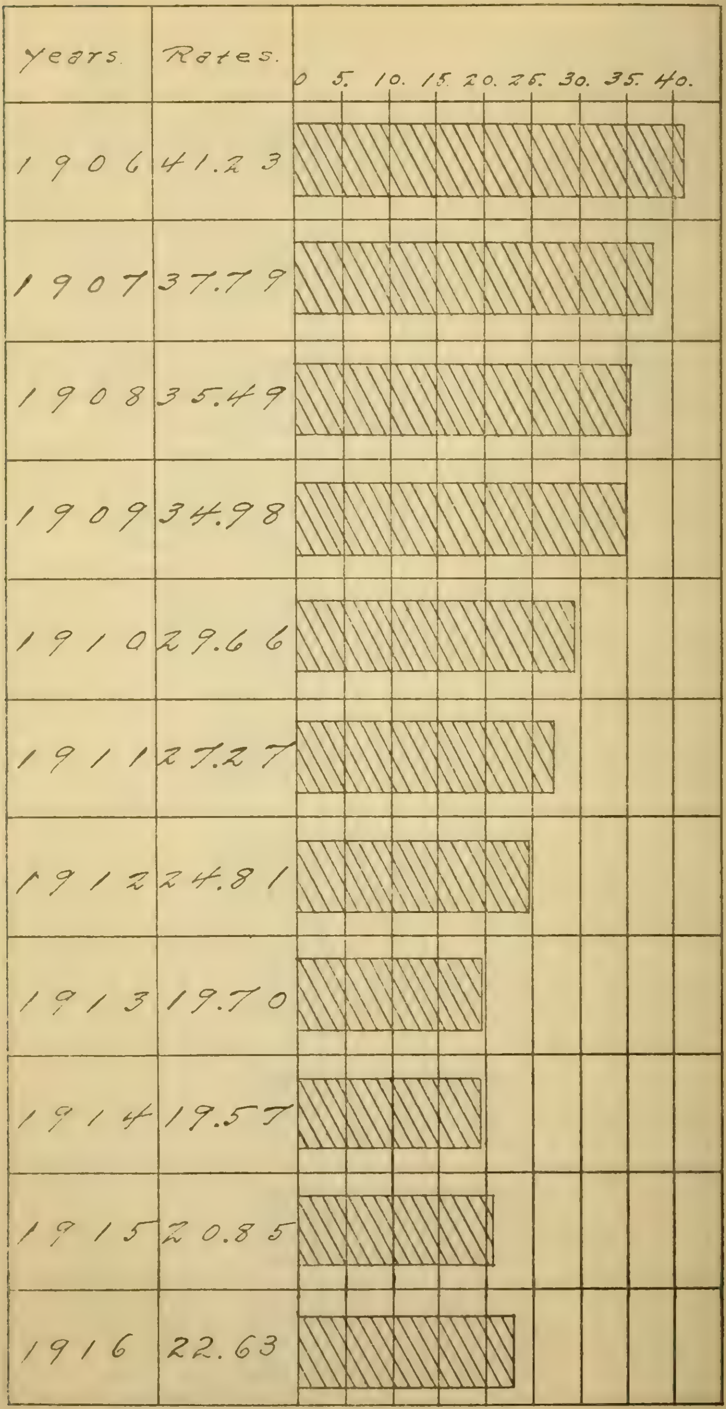
[Noneffective rates for disease, years 1906–1916.]



ing discharged. The reports of these go to the department head-uarters from where discharges are ordered, except in the cases of diers at a recruit depot or general hospital, and the reports of ards on insane patients. In the latter circumstances the reports e sent to The Adjutant General of the Army, who directs the dis-harge or issues the order when insane are recommended to be trans-rred to the Government Hospital for the Insane, Washington, D. C.

The discharge rate for 1914 was lower than for any year since the panish-American War, being 12.99 as compared with 16.52 for merican troops for the year 1916. In 1916 there were in the Army 539 men, American troops, discharged for disability as compared th 1,351 during 1915. The rate for 1867 was 13 per 1,000, and e lowest rate from 1894 to 1898, inclusive, was that for 1895, the west on record in the Army, 9.15 per 1,000. The highest rate in y year for discharge for disability was in 1849, when the total rate r discharge was 76.7 per 1,000. The rate for the entire Army, merican and native troops, was 15.98 per 1,000.

The discharge rate for disease in 1916 (American troops) was 14.42 r 1,000, as compared with 12.79 in 1915, and that for external uses was 2.11 in 1916, as compared with 1.47 in 1915. The dis-ses causing the highest discharge rate in 1916 were as foll solute numbers and rates per 1,000 being given:

Discharges, enlisted men (American troops), year 1916.

Disease.	Number.	Ratio.
ntal alienation	271	2.73
berculosis	218	2.20
nereal diseases	159	1.60
t foot	139	1.40
ilepsy	75	.76
ganic heart disease	56	.56

DEATHS FROM ALL CAUSES.

Chart E shows the total death rate for all causes for the Army from e year 1906 to 1916, inclusive. (See also Table 3A.)

For American troops, enlisted, the total rate for 1916 was 5.21 as mpared with the corresponding rate of 4.60 for 1915 and 4.45 for 914. The rate for 1916 is but little above the rate for 1915, but 914 was the lowest on record in the Army. The highest death rate ccurring in any year was in 1849, when the total rate for deaths was 0.2. The death rate for diseases was 2.60 in 1916, 2.60 in 1915, and .36 in 1914. The total number of deaths in 1916 was 516. The llowing diseases caused the highest number of deaths, absolute umbers and rates per 1,000 being given:

Deaths, enlisted men (American troops), year 1916.

Disease.	Number.	Ratio.
uberculosis	40	0.38
neumonia (lobar)	32	.31
rganic heart disease	18	.17
ppendicitis and typhlitis	18	.17
ancer	14	.13
right's disease	12	.12

The following were the principal causes of deaths, among office and enlisted men, American troops, from external causes, with th number in each instance: Suicides, 63; drowning, accidental, 4 wounded in action, 36; homicide, 30; traumatism by other crushin 29; traumatism by firearms, 24; and traumatism by fall, 13.

INFLUENCE OF STATION ON TROOPS.

Regarding the comparative healthfulness of the various countrie in which American troops were serving during the year (Army transports being excluded), it will be noted that Alaska maintains th lowest admission and noneffective rates, 344.97 and 9.23 per 1,00 respectively; Canal Zone the lowest death rate, 3.99 per 1,00 China the lowest discharge rate, 13.63, the highest noneffective rat 31.31, the highest admission rate, 890.24, and the highest death rat 10.60. Alaska had the highest discharge rate, 21.48.

INFLUENCE OF ARMS OF SERVICE.

The admission rate for disease in 1916 was highest for the Field rtillery, being 908.60, while the Ordnance Corps had the lowest, 32.26 per 1,000.

The death rate was highest in the Engineer Corps, 8.25, and lowest ı the Signal Corps, 3.14, the Field Artillery being next to the lowest ith 3.94 per 1,000.

ABLE No. 4.—*Influence of disease on enlisted American troops of the Army, by arms of service, for the year 1916.*

Appendicitis and typhlitis	.67	9.42	1.02	10.14	.46	6.11	.10	1.05	.16	2
Bronchitis	.65	33.64	.94	34.66	.41	20.86	.27	8.38	.74	33
Malaria	.63	24.25	.84	22.94	.50	18.88	1.67	72.25	1.14	43
Diarrhea and enteritis	.62	48.79	.91	49.00	.57	63.66	.86	51.31	.33	29
Tonsillitis, acute follicular	.57	39.80	.85	41.82	.70	45.67	.17	10.47	.07	5
Measles	.53	12.48	.84	13.98	.03	.90	....	....	.06	
Hernia	.46	4.63	.69	4.97	.51	3.78	....	....	.05	
Influenza	.44	29.75	.63	30.27	.16	8.27	3.43	255.50	.06	3
Acute abscess and cellulitis	.44	16.03	.60	15.69	.45	11.14	.67	38.74	.64	22
Dysentery	.44	6.18	.62	6.17	.65	7.73	.15	5.24	.22	4
Articular rheumatism, acute and chronic	.36	5.56	.50	5.76	.63	4.68	.38	4.19	.16	3

It will be seen from the above tabulation that the white troo have next to the highest rate for venereal diseases, 100.75 per 1,00 the colored troops the highest, with 147.10, while the native troo (Porto Ricans and Philippine Scouts) had the lowest rate, 83.77 a 29.93, respectively.

INFLUENCE OF RACE.

[See Tables 67 and 75.]

Table No. 67 shows that the Porto Rican troops had the highe admission rate, while the colored troops had the highest death a discharge rates. The Philippine Scouts had the lowest admissi and discharge rate, and lowest death and noneffective rates. T admission rates were: White troops, 749.59; colored, 713.90; Phili pine Scouts, 482.17; and Porto Ricans, 1,037.70.

The constantly noneffective rates were: Colored, 32.03; whi 39.17; Porto Ricans, 25.35; and Philippine Scouts, 14.58 per 1,0

The discharge rates were: Colored, 22.12; white, 16.19; Phili pine Scouts, 6.99; and the Porto Ricans, 12.57 per 1,000.

The death rates were: Colored, 7.73; white, 5.06; Porto Rica 4.19; and the Philippine Scouts, 2.69 per 1,000.

The rates for total losses were: Colored, 29.85; white, 21.25; Phili pine Scouts, 9.68; and Porto Rican troops, 16.76 per 1,000.

The average number of days lost for each case treated w Porto Ricans, 8.94; colored, 16.42; white, 13.54; and Philippi Scouts, 11.06 per 1,000.

COMPARISON WITH FOREIGN ARMIES.

As in previous years it has been customary to make an effort to mpare the health conditions in the United States with the same nditions in the armies of Great Britain, the continental powers, d Japan. Owing to the unusual conditions which have existed roughout the calendar year 1916 in Europe, no effort at comparison made in this report.

SURGICAL OPERATIONS.

Table No. 66 shows the principal surgical operations performed by edical officers upon the personnel of the Army. Operations upon milies of officers and enlisted men and other civilians who are en-tled to treatment at Army hospitals at the various posts are not cluded. During the year 1916 there were 10,129 operations per-rmed, of which 10,037 were successful, 31 partially successful, and failures; 52 deaths resulted. Of the anesthetics used, ether was ore prominent, being used in 4,947 cases, chloroform in 99, local esthesia in 3,968, chloroform and ether or gas in 97, and other neral anesthetics in 318 cases. One thousand two hundred and irty-seven appendectomies were performed, 13 resulting in death; 3 herniotomies, and 9 operations for goiter.

UNITED STATES (CONTINENTAL) EXCLUSIVE OF ALASK

ADMISSION RATE.

Cases only are counted; readmissions for the same illness are omi ted in counting cases Table No 81 shows case admissions and tot admissions for enlisted American troops of the Army for the Unit States and American troops, Philippine Islands, 1904 to 1911, i clusive

Admission rates for disease and injuries and total noneffective rate for the United Stat continental (excluding Alaska), years 1911–1916 (enlisted American troops).

Year.	Ratio per 1,000 of mean strength.					
	Admission rate.			Non-effective rate, all causes.	Highest noneff tive rate for d ease.	
	All causes.	For disease.	External causes.		Venereal.	Tuber culosi
1916	745.38	612.52	132.86	30.67	5.58	2.
1915	704.01	564.49	139.52	25.74	3.99	2.
1914	629.84	498.83	131.01	23.37	3.75	2.
1913	619.90	487.94	131.96	22.94	3.58	2.
1912	738.70	596.94	141.76	27.15	5.96	1.
1911	837.00	680.00	157.00	31.40	8.82	1.

The admission rate for 1916, 745.38, is slightly higher than f the preceding year. This rate is compared with the rate for fi years preceding in the total above. The noneffective is higher tha the average for preceding five years.

The mean strength of all troops serving in the United States, bot Regulars and National Guard, year 1916, was 130,394. The cas rate for these troops was 911.72 for all causes, as against 704.01 f Regulars in 1915. The noneffective rate was 25.07; the discharg rate was 15.58 and the death rate was 4.21, as against 25.74, 13.6 and 5.40, respectively, for Regulars in the previous year.

DISCHARGES FOR DISABILITY.

The disability-discharge rate for the United States for 1916 wa 16.76 per 1,000, as compared with 13.60 for 1915, 14.82 for 191 13.45 for 1913, 14.48 for 1912, and 15 for 1911. It will be note that the rate for 1916 is considerably higher than for 1915.

BLE No. 7.—*Discharges for disability. year 1916. United States continental (excluding Alaska).*

Causes of discharge.	Number discharged.	Percentage of total discharges for diseases or external causes.	Discharges for disability.				
			In line of duty.	Not in line of duty.		Discharged for disability before assignment.	
				Contracted before enlistment.	Contracted after enlistment.	In line of duty.	Not in in line of duty.

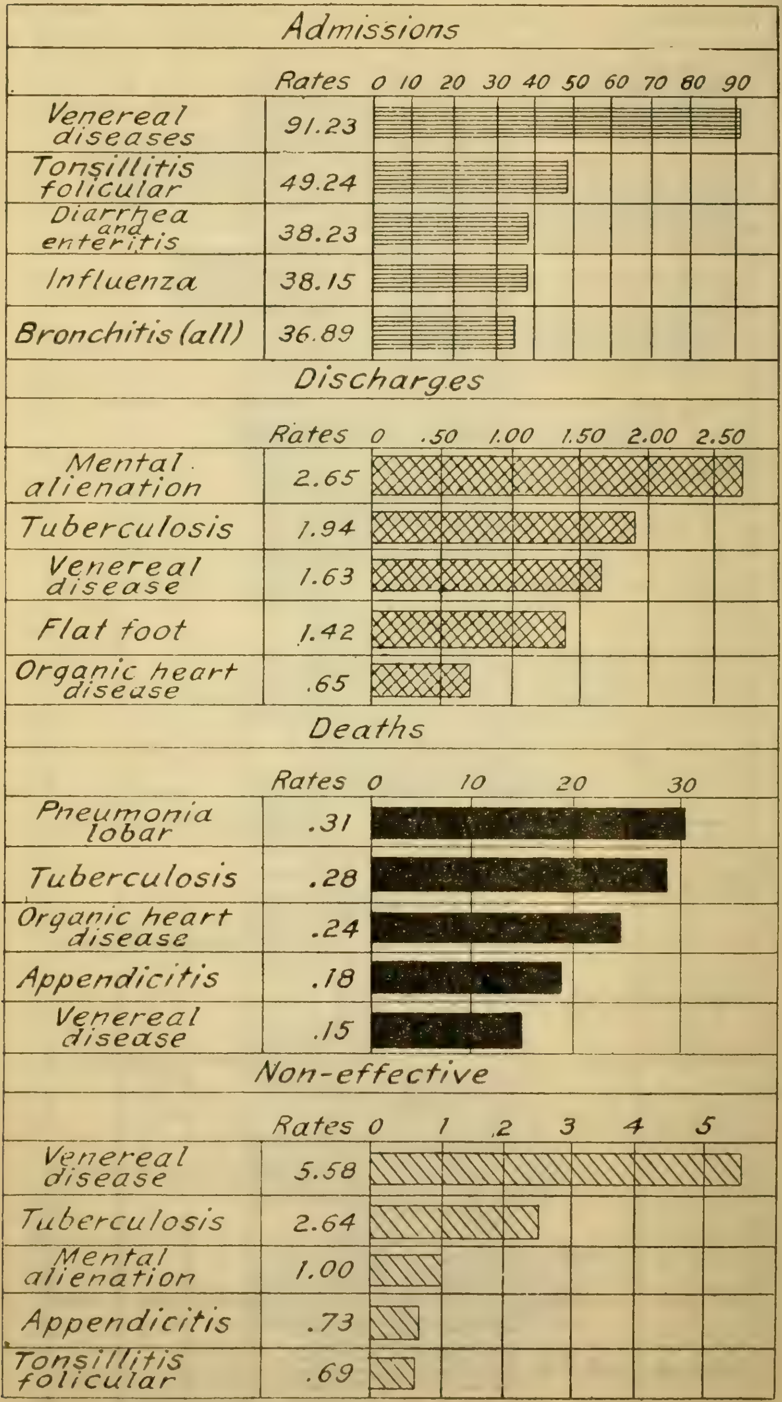
Chart O.—United States. Enlisted men.

[Admission, discharge, death, and noneffective rates for diseases having highest rates, year 1916.]



DEATHS.

The death rate for diseases for the United States enlisted men
s 2.80 per 1,000, as compared with 2.99 in 1915 and 2.52 in 1914.
at for external causes was 2.33 per 1,000 in 1916, as compared with
1 in 1915 and 2.30 in 1914. The total for diseases and external
uses was 5.13 in 1916, as compared with 5.40 in 1915 and 4.82 in
14. The total number of deaths in 1916 was 315; of this number
2 were due to disease and 143 to external causes. Deaths as
ll as discharges which occurred in the United States among those
o have been invalided home from their commands in foreign
rvice have been changed to the country where such commands were
ationed. Tuberculosis caused 17 deaths in 1916, 18 in 1915, and
in 1914; measles 9 in 1916, 20 in 1915, and 8 in 1914; pneumonia
bar) 19 in 1916, 28 in 1915, and 15 in 1914; and appendicitis 11
1916, 10 in 1915, and 9 in 1914. There were 35 suicidal deaths in
16, 40 in 1915, and 37 in 1914; 92 accidental deaths, 21 of which
re by drowning, 17 by crushing, and 18 by firearms in 1916, as
mpared with 104 deaths in 1915 and 85 in 1914.

The following table shows the whole number of deaths occurring
nong both officers and enlisted men, the difference accounting for
ficers' deaths, which are used above, in order that accurate com-
rison could be made with statements from last year's report:

PREVALENCE OF SPECIAL DISEASES.

TYPHOID FEVER.

Twenty-five cases of typhoid fever (officers and enlisted men) oc-irred in the entire United States Army during the calendar year 1916. xteen of these were among troops stationed in the United States; ie other nine occurred in the island possessions. During the year ie Army was scattered over the earth through a wide range of lati-ide in Alaska, in Panama, in China, in Porto Rico, in Hawaii, in the hilippines, in Mexico, and in the various camps, posts, and garri-ons north, south, east, and west of the continental territory of the nited States. The mean strength for the year was 110,454.

There were three deaths from typhoid fever, of which two were ficers.

Of the 25 cases reported, 5 were in the person of officers and 20 in ilisted men, including 3 recruits. All except 1 enlisted man re-eived the antityphoid vaccination; 1 officer 3 years, 8 months, and days before, another officer received 3 doses in 1910 or 1911, 1 in 912, 1 date unknown, and 1 with no information regarding vacci-ation.

Of 9 cases (7 in Mexico and 2 Schofield Barracks), 3 were enlisted en of the same organization, Thirteenth Cavalry, and 1 an enlisted an of the Fifth Cavalry, 2 of the First and Sixteenth Infantry, spectively, and 1 Field Artillery.

Revaccination against typhoid fever upon reenlistment is now quired in the same way as revaccination against smallpox. Officers e required to be revaccinated five years after the first course. fter two completed courses of vaccination are given no further is quired.

Duration of immunity: The question of the duration of immunity nferred by antityphoid vaccination is still an open one, statistical formation being at this time too meager to draw definite and satis-ctory conclusions on this point.

The English observers from their experience in India and elsewhere ave inclined to the belief that the protection against typhoid fever rnished by the vaccination as they give it begins to decline between ie second and third year following administration.

Students of this subject in our Army, including those most com-etent anywhere to discuss the matter, have with few exceptions scribed a much greater degree and longer period of protection gainst typhoid, when the vaccination was made with the vaccine repared by the Medical Department of the Army and given, as now rescribed, three doses at intervals of 10 days, a total of 2½ cubic entimeters, the first dose being one-half cubic centimeter, the cceeding doses 1 cubic centimeter each.

It is generally understood, of course, that the protection from the yphoid vaccine has never been considered absolute in all individuals, a certain small percentage of persons being incapable of complete immunization against the disease, as is shown by the fact that actual attacks of typhoid fever itself do not always afford freedom from a second attack. Other reasons for the appearance of typhoid among those vaccinated are inert vaccines or defective methods of administration and unusual exposure to highly infective typhoid material.

It may be stated that the disease occurring after antityphoid vaccination, with but few exceptions, shows a much milder course than ordinary, and the death rate is markedly lower among those who have received the antityphoid vaccination.

The following tabulation is for the purpose of comparing the figures for 1916 with those for the years 1915 and 1914:

Typhoid fever, the Army, officers and enlisted men. American and native troops.

Year.	Cases.		Deaths.		Immunized persons.	
	Number.	Rates for 1,000 mean strength.	Number cases.	Rates for 1,000 mean strength.	Cases.	Deaths.
1916	25	0.23	3	0.03	14	1
1915	8	.08	....	....	7	....
1914	7	.07	3	.03	1	....

Attention is invited to Chart P, showing the admission and death rates for officers and enlisted men serving in the United States. This chart shows graphically the remarkable decrease in both rates as the result of the use of the antityphoid vaccination. This vaccination was begun—but was voluntary—in 1909, and was made compulsory for the entire Army in 1911. (For the various steps from voluntary to compulsory vaccination, vide annual report of this office for 1912, pp. 52 et seq.)

The increasing use of antityphoid vaccination as a prevention against typhoid by the National Guard is to be encouraged. This procedure is now necessary before these troops can be mustered into the Federal service, or be accepted as volunteers; and to have this already accomplished is to materially expedite the mustering in of such troops. It is also deemed desirable, in order that standardized reports may be obtained, that the vaccine made for the Regular Army and supplied by the laboratory, Army Medical School, Washington, D. C., be used for the troops liable to service.

PARATYPHOID FEVER.

Table No. 10 shows that 114 cases of paratyphoid fever occurr in the entire Regular Army during the calendar year 1916. Ninet one of these cases were reported from Mexico and 1 from Chin leaving but 22 distributed throughout the United States—18 on tl border, 2 at Fort Sam Houston, Tex., and 2 at Fort Bliss, Tex.

It is, of course, well understood that paratyphoid fever is a distin clinical entity and is not typhoid fever, though sometimes resembli atypical cases of that disease. It is caused by a different micr organism, the bacillus paratyphosus, of which two types are di tinguishable—*B. paratyphosus* A and *B. paratyphosus* B. In weste Europe, as reported, paratyphoid fever is much more frequently d to the B type of bacillus than to the A type. Clinically they a hardly distinguishable, but it is stated that A fever is apt to last thr or four days longer.

An important feature in the prevention of paratyphoid fever, as typhoid fever is the active searching out of "carriers" and th prompt isolation and treatment.

TABLE No. 10.—*Paratyphoid fever, 1916.*

[Officers and enlisted men (total).]

	Regulars.		National Guard.		Total.	
	Cases.	Deaths.	Cases.	Deaths.	Cases.	Deatl
Army:						
Number	114	....	296	4	410	
Ratio	1.03	....	4.49	0.06	2.32	0
United States:						
Number	22	....	296	4	318	
Ratio	0.34	....	4.49	0.06	2.44	0

Of the 296 cases and 4 deaths occurring in the entire Natior Guard during the year, 215 cases (29.07 per 1,000)and 3 deaths we reported among the New York State troops, and of this number cases are charged to camps located in that State and 171 cases anc deaths to stations on the Mexican border.

It may be stated at this time that paratyphoid fever, heretof but infrequently met with in our Army, appeared in the New Yo division of the National Guard, stationed in the Brownsville distri in August, 1916, principally among the troops at Mission, Tex. few scattering cases at other points occurred in the same district; all, a total of 120 cases.

The outbreak of this diease was promptly and satisfactorily m The vaccination against paratyphoid with a mixed paratyphoid and B vaccine prepared in the laboratories of the Army Medi School was authorized, the searching out of possible "carriers" the disease was vigorously prosecuted, camp sites were changed, a all sanitary orders rigidly enforced under the direction of inspect of the Army Medical Corps.

VENEREAL DISEASES.

Special measures for protection against this class of infectious eases were formulated six years ago, since which time, so far as in the power of the Medical Department, they have been vigorsly and conscientiously carried out, and it is further believed that the great majority of instances there has been no laxness in the ict enforcement of the regulations by others in military authority. should be understood that the prime source of infection in venereal eases lies not within military jurisdiction and control, but in the ilian life, quite apart from the immediate garrison life of the soldier d the rigid supervision incident thereto.

The admission rate for enlisted men in the United States is som what higher than for 1915, being 91.23 compared with 83.60 per 1,00

The noneffective rate was considerably higher, being 5.58 per 1,0 for 1916 as against 3.99 in 1915, which may be accounted for by t presence in hospital for a greater length of time of cases of syphil There was an increase in the number of cases so diagnosed of 29 ov 1915. For gonorrhea the number of cases is 146 more than last yea and in the local infection, chancroid, the increase is 100. In 19 there was a large falling off in the number of secondary and tertia cases of syphilis and a decrease in the case rate for the primary cas It will be noted from Table No. 15 that a like decrease has tak place in the number of cases of tertiary syphilis for 1916, while the is an increase in the rate for primary cases.

In comparing the figures for 1916 and 1915 with those for 19 and 1914 and the preceding years it must be borne in mind that t diagnoses made prior to 1911 were determined without the aid of t Wassermann reaction. By reason of this many latent cases are n detected which were largely missed prior to 1911.

By reference to Table No. 12 it will be seen that the admissi rate for the total American troops of the Army also was lower th for the year 1915, the rate being 103.35 as against 107.71, while t noneffective rate was higher, being 5.62 per 1,000 in 1916 as co pared with 4.78 in 1915.

Table No. 16 shows the rates of admission for three years of enereal disease at the five recruiting depots. Of the five recruiting tations, two—Forts Slocum and McDowell—show a slight decrease ver the rates for 1915, Fort Slocum having the lowest rate for 1916. aking the five recruit depots as a whole, the total admission rate s higher for 1916, being 120.01, as compared with 102.68 in 1915 nd 113.66 for 1914. Jefferson Barracks has the highest rate of any f the depots, 167.45 per 1,000 in 1916, as compared with 157.11 in 915, with a rate of 148.76 in 1916 at Columbus Barracks, as compared ith 94.34 for 1915.

Table No. 17 gives the relative standing and rates with reference o venereal disease for 38 posts in the United States. The post aving the highest rate for venereal disease is Fort Sam Houston, ex. The fact that Fort Sam Houston leads all other posts for venereal disease this year can be accounted for by the mobilizatio of a good portion of our troops on the southern border. But suc facts seem only to extenuate, but not to excuse, the failure to lowe the ratio of these preventable diseases.

The most marked improvement is shown at Presidio of San Fra cisco, where the admission rate was reduced from 119.05 in 1915 t 62.73 per 1,000 in 1916; where formerly Presidio stood No. 7 on th list, this year it stands No. 19; Fort Screven, which last year stoo No. 6 on the list, this year stands No. 16, while Fort Clark move from No. 15 last year to No. 23 this year.

MALARIAL FEVERS.

The admission rate for malarial fever, officers and enlisted men, i the United States for 1916 is slightly lower than for the year 191 being 12.19 per 1,000, as compared with 12.37 in 1915. The rate for 1914 was 10.74; that for 1913, 8.62; that for 1912, 13.99; and fo 1911, 14.35.

The noneffective rate for 1916 was 0.34, as compared with 0.2 in 1915, 0.24 in 1914, 0.18 in 1913, and 0.29 per 1,000 in 1912.

No discharges, but two deaths, resulted from malarial fevers du ing the year. Chart R shows comparative rates for this disease fo the entire command, including officers.

ABLE No. 20.—*The 10 posts of more than 200 (officers and enlisted men) in the United States, continental (excluding Alaska), having the highest admission rates for malarial diseases, year 1916, compared with 1915.*

[Ratio per 1,000 of mean strength.]

	Mean strength.		Malarial diseases total ratio.	
	1916	1915	1916	1915
fferson Barracks, Mo	1,481	1,413	53.34	37.51
ort Sam Houston, Tex	2,135	1,293	30.45	17.79
ort Sill, Okla	925	1,182	27.03	26.23
ort Myer, Va	513	694	13.65	27.38
ort Screven, Ga	387	444	10.34	22.52
ort Leavenworth, Kans. (military prison)	316	272	9.49	22.06
ort Moultrie, S. C	358	397	8.38	73.05
'ashington Barracks, D. C	330	508	6.06	33.46
ort Caswell, N. C	201	290	4.98	17.24
ort D. A. Russell, Wyo	232	264	4.31	26.52

From the above table it will be noted that Fort Moultrie, S. C., vhich had an admission rate in 1915 of 73.05, this year shown 8.38 er 1,000, a remarkable reduction, due to the vigorous antimosquito ampaign that is being waged where mosquitoes are prevalent.

TUBERCULOSIS.

The following tabulation shows for the total American Army, and eparately for the different countries where the Army has been tationed continually, the case rate for tuberculosis (all forms) for nlisted men for the last seven years. In this tabulation all readmisions during each year have been eliminated, so that the actual ccurrence of tuberculosis (all) is shown:

Tuberculosis (all), enlisted men, case rates only.

Year.	United States.	Philippine Islands.	Alaska.	Hawaii.	Transports.	Panama.	China.	Total.
916	3.53	3.96		3.19	2.43	4.13	1.51	3.45
915	2.68	6.42	1.31	3.62	5.34	6.12	5.24	3.52
914	2.69	7.31	1.09	3.01	2.85	2.49	6.69	3.35
913	3.07	6.70	1.75	4.24	4.37	3.76	3.29	3.66
912	3.25	5.02	4.18	2.07	2.74			3.49
911	3.64	3.77	2.68	1.99	1.76			3.55
910	3.34	5.46	1.85	4.10	.80			3.65

The above tabulation shows that for the year 1916 the case rate or tuberculosis in the United States is higher than for any previous 'ear recorded with the exception of 1911, 3.64, being 3.53, as comared with 2.68 per 1,000 for 1915. The general rate for the Amerian Army was 3.45, which is slightly lower than for the year 1915. ll of the places shown in the tabulation have lower rates for 1916 han for the United States, with the exception of the Philippine slands and Panama, the rates for which are 3.96 and 4.13 per 1,000, s compared with 6.42 and 6.12 for 1915. The other places show a lecrease in their rates when compared with 1915 and, with the exeption of the Philippine Islands and Panama, show a decrease in ate for 1916 to that for the American Army.

The following tabulation shows for the total American Army and for those parts stationed in the United States and the Philippine Islands, the rates for tuberculosis (all) for discharges for disability, for deaths, and for noneffectiveness for the last four year

Tuberculosis (all) total American Army, United States and Philippine Islands, yea 1913 to 1916 (enlisted men).

	Year.	Discharged for disability.	Deaths.	Non-effectiv

	1915	1.67	.28	2.
	1914	2.10	.47	2.
	1913	2.16	.40	2.
American troops, Philippine Islands	1916	2.25	.95	.
	1915	3.28	.50	.
	1914	3.41	.28	.
	1913	3.95	.79	.

Table No. 21 gives the occurrence of tuberculosis at Army posts i the United States. Fort Sam Houston, Tex., shows the admission o 12 cases, the highest number reported; Vancouver Barracks shows cases admitted as against 7 in 1915. Forty-four more cases of thi disease occurred than during the year 1915, and an increase ove 1914 of 48 cases.

TABLE NO. 23.—*Undetermined fevers, 1916, by countries, officers, and enlisted me including Philippine Scouts and Porto Rican troops.*

Diseases.	United States (continental), excluding Alaska.	Mexico.	Alaska.	Hawaii.	Philippine Islands.	Canal Zone, Panama.	China.	Porto Rico.	Army transports.	Tota
Febricula	92				71			4	9	1
Fever, simple, continued										
Fever, type undetermined	183	202		3	22	22		34	1	4
Ephemeral fever										
Total	275	202		3	93	22		38	10	6
Ratio per 1,000 of mean strength	4.27	24.21		.34	5.22	3.13		38.35	11.36	5.

From the above table it will be noted that the admission rate for se fevers in the United States was 4.27 per 1,000 of mean strength. e same rate for 1915 was 1.65, that for 1914 was 1.49, and for 13, 2.65 per 1,000. Porto Rico has the highest admission rate for s class of fevers, 38.35 per 1,000; Mexico comes next with 24.21 1,000. The rates for the United States, Hawaii, Philippine ands, and Canal Zone are lower than the total rate for these fevers. might be well to again state, as in previous reports, that in ques- ns of doubt procedures are used in the laboratory diagnosis of hoid and paratyphoid fevers so as to exclude any possibility of erlooking these two diseases.

MENTAL ALIENATION (ENLISTED MEN).

It is impracticable to compare the admission rate for this class of sturbances with the rate for diseases formerly classified and pub- hed under the term "insanity." The diseases included under the m "mental alienation" used in the present nomenclature, which s put into use January 1, 1912, include several conditions not ken into consideration under the term "insanity," such as defective d mental development, constitutional psychopathic state, hypo- ondriasis, and nostalgia. The case admission rate for mental enation (all) for 1916 for the United States was 3.73 per 1,000, and e discharge rate 2.65, as compared with 3.04 per 1,000 for the mission rate and 2.54 for discharge rate during the year 1915. e admission and discharge rates for the entire Army for 1916 were 5 and 2.61 per 1,000, respectively.

ALCOHOLISM.

The admission rate for alcoholism in the United States for the ar 1916 was 12.33 per 1,000, which is lower than for the preceding ar, when it was 13.07. It is exceedingly gratifying to note that ere has been a steady decrease in this rate since 1907, when the te was 36.09, before which year there was a steady increase for ht years. The rate for 1916 is the lowest on record in the Army ce the year 1870. As it has been stated before, the rates given e not representative of the true amount of temperance existing in e Army, but as they are all calculated from similar data, i. e., the mber of cases in which medical assistance intervenes, they are eful as indices of alcoholic excesses. There can be no doubt but at this remarkable decrease in the rates is properly attributable the effect produced by the act of Congress in stopping the pay of icers and enlisted men when incapacitated for duty because of kness due to drug addiction, alcoholism, or other misconduct.

SMALLPOX.

No cases of smallpox occurred within the United States proper ring the year.

MEASLES.

During the year 1916, 1,247 cases of measles occurred in the Army the United States, with 9 deaths and 2 discharges. In 1915 there re 555 cases, with 20 deaths and 8 discharges. The depots having e highest number of admissions for the year were Columbus rracks, Ohio, with 400 cases and 7 deaths, and Jefferson Barracks, ., with 319 cases and 1 death. The mean strengths during the ar at the above-mentioned depots were: Columbus Barracks, 331; Jefferson Barracks, 1,481.

The diversion of accepted applicants to other stations resulted in e disease assuming no greater proportions than shown at Columbus rracks. With the advent of milder weather the change in habitat m the barracks to out-of-door life usually marks a decline in the idence of the disease, which would tend to bear out the contention at crowding is a very material factor in the spread of this disease.

CEREBROSPINAL MENINGITIS.

Eighteen cases of this disease, with 9 deaths, occurred during the ar 1916 in the United States. In 1915 there were 23 cases with leaths.

INFLUENCE OF STATION.

The posts having the highest admission rates, from all causes, were: rts Sam Houston, Tex., with a rate of 1,120.84; Oglethorpe, Ga., th a rate of 1,072.73; Crockett, Tex., 1,064.66; Greble, R. I., 03.45; and Bliss, Tex., 994.03.

The posts having the highest noneffective rate for the year 1916 re: Forts Bliss, Tex.; Huachuca, Ariz.; Sam Houston, Tex.; attsburg Barracks, N. Y.; and Crockett, Tex.; in the order named. e rates from all causes were 188.71, 81.68, 68.41, 36.94, and 33.55 r 1,000, respectively. The average number of days' treatment each case was as follows: Forts Bliss, 69.48; Huachuca, Ariz., .76; Sam Houston, 22.34; Plattsburg Barracks, 17.96; Crockett, x., 11.53.

The five posts having the lowest admission rate, from all causes, ring the year, were: Forts Casey, Wash., 315.48; West Point, Y., 353.57; Flagler, Wash., 386.04; Stevens, Oreg., 407.05; and rry, N. Y., with 426.91 per 1,000.

The posts having the lowest noneffective rates, from all causes, with eir rates, were: Forts Hamilton, N. Y., 8.88; West Point, 9.07; Intosh, Tex., 11.51; Flagler, Wash., 12.54; Worden, Wash., 12.56 r 1,000. The average number of days' treatment for each case s 6.59, 9.39, 5.78, 11.89, and 9.79, respectively.

Of the recruiting depots Columbus Barracks, Ohio, the highest mission rate from all causes, 1,384.67, and Fort McDowell, Cal., e lowest, 841.05, per 1,000; Jefferson Barracks, Mo., had the highest erage number of days' treatment for each case, 12.57, also highest noneffective rate from all causes, 41.47 per 1,000, and Fort McDowel Cal., the lowest, 4.71. The highest death rate occurred at Fo Logan, Colo., being 11.49 per 1,000, and the lowest at Fort Slocum N. Y., 1.72.

The Western Department, as last year, had the lowest admissio rate, 525.71 per 1,000, as compared with 556.47 for 1915, with t exception of the independent stations, which had a rate of 491. per 1,000, as compared with 508.43 per 1,000 for 1915. An increa is noted in the Eastern Department, whose rate for 1916 was 668.7 as compared with 654.32 per 1,000 for 1915. The rate for the recru depots remains high, and is still higher than for 1915, being 1,124. for 1916, as compared with 1,070.17 per 1,000 for 1915.

The Western Department has the lowest noneffective rate, 10. per 1,000, for the year 1916, as compared with 11.82 for the ind pendent stations, 16.12 for the Mexican border, and 18.03 for t Eastern Department.

The Western Department had the lowest death rate, 2.16 per 1,0 for 1916, as compared with 6.26 for 1915, and the Eastern, t Mexican border, the Central, and the Southern next in order with 2. 4.34, 7.82, and 12.65 per 1,000, respectively.

Tables Nos. 24 and 25 show the posts having the highest and t lowest ratios of admission and noneffectiveness in the United Stat as a whole.

INFLUENCE OF RACE.

The colored troops (enlisted) had higher rates than the white f noneffective and discharges, being 100.52 and 31.36, as compared wi 29.72 and 16.56 per 1,000, respectively, for 1916. The respecti rates for 1915 were 31.26 and 22.96, as compared with 25.52 and 13. The admission rate for white troops was lower than for the color being 743.40, as compared with 890.23.

For venereal diseases the admission rate for the white troops w 90.34, and for the colored 156.82 per 1,000 for 1916; for alcoholi the rate for the white troops was 12.84, and for the colored 7. for tuberculosis (all kinds) for the white was 3.47, and for the color 8.44; for bronchitis the rate for white was 36.98, and for color 31.36; for diarrhea and enteritis the rate for white was 38.44, a for colored 22.92; and for tonsillitis, acute follicular, the rate white was 48.13, and for colored 130.28. The relative prevale of the other diseases in the two races with comparisons are sho in Table No. 7.

GENERAL SANITATION.

CONTROL OF COMMUNICABLE DISEASES.

1. In carrying out effective sanitary measures in the military servce, particular attention should be paid to certain of the communicable diseases. The following notes are published for the information and guidance of medical officers and others whose duties impose upon them the prevention of disease among the troops of the United States.

2. The practice of modern sanitary science may be summarized in the statement that its main object is to seek the sources amongst nfected persons and animals whose excreta or other constituents or body contents enter the bodies of other persons. Its main postulate is that the routes of infection are simply the routes of infected bodily discharges, which are the routes of ordinary uninfected discharges in ordinary life.

3. The influence of environment depends upon whether or not it permits of or necessitates the exchange of human discharges. Overcrowding, if combined with lack of discipline and order and lack of facilities for washing, especially of the hands, contributes to the spread of infection, not of itself, but only if infection be introduced nto the community. Overcrowding, if there is discipline and intelligence with proper precautions to avoid the exchange of excreta, does not spread infection even if it be introduced.

4. Water, food, flies, and milk are the main public routes of gastrontestinal infection from individuals to group, and from group to group. Contact is the great private route from individual to individual. Contact infection radiates directly from the infected person through nose, mouth, bladder, and bowel discharges. The great route of exchange is by smears on the hands, although mouth spray and sputum also act in many diseases. If we classify the chief communicable diseases of the temperate zone by their principal routes of infection we plainly see that of all the routes, contact alone is common to all diseases.

5. A program of military sanitation should aim—

(*a*) To secure to each individual continuously the highest possible health.

(*b*) To secure to each, instruction, and training in personal conduct in order to avoid receiving into his body the discharges of infected persons.

(*c*) To secure to each specific immunization.

These three measures place the abolition of infection directly upon the individual. The three following place the abolition of infection upon experts who deal directly with the infection itself:

(*a*) The supervision of the four great public routes of infection to exclude all bodily discharges from them.

(*b*) The supervision of all known infectious cases to exclude their discharges from all routes.

(*c*) The sociological supervision of all infected persons.

TYPHOID FEVER.

Cause.—The bacterial cause of typhoid fever is a rod-shaped microorganism or germ called the typhoid bacillus.

Nature.—Typhoid fever is chiefly a filth disease, and is widely distributed over the world. The typhoid bacillus is present in the feces and urine of all persons who are ill with the disease and of certain persons who have long recovered from it. The latter persons are referred to as carriers of the bacilli, or typhoid carriers.

Means of communication.—Lack of care in the disposal of the excreta and want of personal cleanliness are the chief sources of the disease. A faulty method of disposing of feces and urine may lead to contamination of drinking water, milk, or other food directly or through the agency of flies.

Human excrement should be properly disposed of, breeding places of flies destroyed, food supplies protected, and persistent warfare against the fly unceasingly carried on.

Sources of the disease in military camps.—The commonest mode of infection in military establishments is through personal contact, especially by means of the hands, with individuals who harbor the typhoid bacillus. Sometimes this contact is direct, sometimes indirect. About 60 per cent of the cases are believed to arise in this manner.

The direct instances are those in which infection follows upon personal association with an infected person or carrier. The indirect ones are such as from clothing, bedding, water, milk, or other food, and the dishes or drinking cup of an infected person.

The carrier is therefore, because unsuspected and more insidious, a greater source of danger than the sick person. The medical officer should be on the alert to suspect and detect him. Once detected, he requires particular care in respect to isolation and treatment. The carriers who handle or prepare food are especially dangerous. In order to avoid increase in carriers, no patient convalescent from typhoid fever should be released until three successive examinations of the stools and urine, collected at six-day intervals, have shown him to be free from typhoid bacilli.

Personal precautions to be observed.—From what has been stated it is obvious that habits of personal cleanliness are to be encouraged in every way. Bathing should be frequent, the washing of the hands before eating and after visiting the latrine should be obligatory, and due attention paid to the laundering of underclothing. The eating and other utensils used by persons sick of typhoid fever and carriers of the typhoid bacilli should be promptly sterilized.

PARATYPHOID FEVER.

Causes.—Like typhoid fever, paratyphoid fever is produced by bacteria. Two bacilli, known as paratyphoid A and B, are its bacterial causes.

Nature.—Paratyphoid fever, like typhoid fever, is a filth disease and as such is to be dealt with precisely as is typhoid fever. In addition, the paratyphoid bacilli B occur in animals and may be present in their flesh. Hence, such infected foods when improperly cooked or preserved may give rise to paratyphoid fever. This form the disease constitutes one of the kinds of food or meat poisoning. althy carriers of the paratyphoid bacillus also exist.

Vaccination.—Typhoid vaccination does not protect against para- phoid infection. It is therefore necessary to vaccinate against ratyphoid as well as against typhoid fever. For this purpose a ccine is supplied containing both the A and B bacilli. It is ected in the same manner as the typhoid bacillus vaccine.

Distinction between typhoid and paratyphoid fever.—These two kinds fever are often indistinguishable clinically. But laboratory test ethods serve to distinguish them from each other. Every case of determined fever, and every case of clinical typhoid or paraty- oid fever should have a blood culture made not later than the th day, this culture to be examined at an Army laboratory, unless ecific authority to do otherwise is given by the Surgeon General's fice. A subculture from any positive blood culture will be sent to e nearest department laboratory for confirmation and record.

Typhoid and paratyphoid vaccination.—All persons entering the ilitary service will be vaccinated against typhoid and paratyphoid vers, under the direction of a medical officer, as soon as practicable ter entrance. Exception may be made in the case of persons over years of age, and when the occurrence of a previous attack of phoid fever or a complete course of vaccination within three years established to the satisfaction of the responsible medical officer.

Officers under 45 years of age will be revaccinated after three years, d enlisted men on reenlistment.

Vaccination will consist of a series of three injections given exactly in the first series.

Recruits will be vaccinated at places of enlistment, unless, because special assignment or other reason, the men are not to remain at e station long enough to allow the completion of the course, in hich event the vaccination will be completed immediately after they in the organizations or stations to which they are assigned. On e service record of every recruit or reenlisted man will be noted Typhoid and paratyphoid vaccination completed (date) -------." or Typhoid and paratyphoid vaccination not administered," as the se may be. In the latter case, company and detachment com- anders will see that the vaccination is begun immediately after the en join the organizations or stations to which assigned.

Civilian employees who are subject to field service of any kind, cluding those on transports and in the mine-planter service, will vaccinated as soon as employed.

Records will be kept of all officers, soldiers, and civilians in the ilitary service who receive the antityphoid and antiparatyphoid ccinations, giving the dates of vaccination.

The following directions for vaccination against typhoid and ratyphoid fevers are published here for the information of medi- l officers:

The first dose is ½ c. c. (7½ m.); the second and third are each c. c. (15 m.). An interval of at least seven days should elapse tween doses. This interval may be extended to the fourteenth y in case of necessity.

The site of inoculation is the arm at the insertion of the deltoid uscle. If for any reason this site can not be used, the needle may introduced into the back over the lower portion of the scapula, or in the chest below the clavicle. The dose is to be given subc taneously and not into the muscles nor into the skin. The arm shou be cleansed as for any other operation. Tincture of iodine painte over the dry skin, before and after the injection, has proved sati factory.

The ampule should be washed off in an antiseptic solution an opened after making one or more cuts near the top with a file. Th vaccine can be drawn out of the container with a syringe, or it ma be emptied into a shallow glass dish, such as a saltcellar, which ha been sterilized by boiling.

The syringe and needle should be sterilized by boiling in 2 pe cent soda solution. To insure perfect sterilization, draw the pisto out to its full length, or remove it entirely so that the barrel is fu of water during the boiling. A fresh needle should be used for eac man, or if one needle must be used on two or more men, it should b resterilized, before each injection.

No person should be vaccinated who is not perfectly health and free from fever. The temperature should be taken in doubtfu cases and the urine should be examined; if fever or any other sym toms of illness are present, the procedure should be postpone These precautions are necessary to avoid vaccinating men who ma be in the incubation stage of typhoid or other fever. Neither bee nor alcohol in any other form should be drunk on the day of trea ment. Vaccination is well borne by children and by women, usin doses proportionate to the body weight, taking 150 pounds as th unit. Women should not be given the first dose during or near th time of the menstrual period.

The most suitable time for the administration is about 4 o'cloc in the afternoon, as the greater part of the reaction is then ove before morning. There is usually some headache and malaise, an a local reaction consisting of a red and tender area about the siz of the palm of the hand, and sometimes tenderness in the axillar glands. It is best not to require any duty for 24 hours, nor to pe mit active exercise, such as long rides or walks. Rarely, marke general reactions occur—headache, backache, nausea, vomitin herpes labialis, occasionally albuminuria, and some loss of bod weight. The number of such reactions is exceedingly small, an regardless of their severity they as a rule disappear inside of 4 hours.

The Widal reaction is positive after typhoid vaccination, appea ing in about 10 days after the first dose, and it remains positiv for six months to a year. This fact must be considered in diagnosin typhoid in vaccinated persons. They may give a positive Wida regardless of the nature of the illness, and reaction is frequentl of no assistance in diagnosis.

The vaccines should be stored in an ice box. They will keep fo four months and perhaps longer when stored at low temperature in the dark.

A fresh ampule should be opened for each day's use. Any vaccin remaining unused in an opened ampule at the end of the day shoul be thrown away. The only vaccines used will be those obtaine from the Army Medical School, and will be furnished on reques by information slip or by telegram to the commandant. When fo any reason a larger stock is on hand than appears to be needed

·ections as to disposition will be obtained from the commandant, my Medical School, upon application to him directly, stating date receipt of the vaccine. Stock over four months old will be destroyed ıen a new supply has been received.

CHOLERA.

Cause.—The bacterial cause of cholera is a comma-shaped bacillus own as the comma or cholera bacillus.

Nature.—Two main forms of cholera are distinguished. In one pe of the disease large epidemics break out more or less suddenly. these cases the cholera bacillus is contained in the drinking water. the other form of the disease the cases occur separately and occa- nally; they arise from contact with other cases of cholera, with olera bacillus carriers, or from filth contamination by flies, as in e manner of spread of typhoid fever.

The cholera bacillus breeds in the intestine of man and escapes th the intestinal discharges. Gaining access to water supplies, it rvives there for a time. Upon the hands, clothing, etc., it may be rried to healthy persons by contact. In the cholera patient only e intestinal discharges contain the bacilli.

Prevention.—The control of the drinking water is imperative to oid water-borne epidemics. The cleansing of the hands, disin- tion of clothing, bedding, eating utensils, etc., are necessary to event contact infection. The discovery and isolation of carriers, ıo in infected localities may constitute from 5 to 10 per cent of e population, should be assiduously attended to. Carriers are an pecial menace when they are engaged in the handling and prep- ıtion of food. Should cholera appear, the things to be especially pt in mind are:

(1) Close watch over the persons who have to do with the handling food.

(2) The safeguarding of water and milk. The latter should always boiled before use.

(3) The use only of food recently cooked.

(4) The screening of kitchen and mess halls.

(5) The reduction of flies by trapping and killing, and the de- uction of their breeding places.

DYSENTERY.

Causes and nature.—Dysentery or inflammation of the large testine is caused by two classes of microorganisms, an amœba and rtain bacteria. The former gives rise to amœbic, the latter to cillary dysentery. The bacterial or bacillary form of dysentery more widely distributed over the world than the amœbic. While e former is found in all climates, the latter is chiefly restricted to ırm countries. But persons suffering from amœbic dysentery ay carry the disease from a warm to a cold climate.

Sources of infection.—The amoebae and bacilli which cause dysen- ry are contained in the intestinal contents and are discharged with em. They are, therefore, subject to the same manner of distribu- on as are the typhoid bacilli and the preventive measures to be employed are identical with those employed in typhoid fever. I may be well, however, to emphasize the common occurrence c carriers of dysentery bacilli and amoeba among exposed and recov ered cases, and the necessity of enforcing habits of personal cleanl ness and other related measures to control the disease.

Diarrhea.—In addition to dysentery, slighter and nondysenteri forms of intestinal trouble are more or less common. As the resu of chill and indiscretion in diet, diarrhea, griping, and even blood stools may arise. But any case of persistent diarrhea in whic blood and mucus are being discharged should be regarded as sus picious and submitted to a laboratory examination in order to dete mine whether it may be dysentery. The amoebae are searched fo by direct microscopical examination; the bacilli may be obtained i culture, or an agglutination test made with the patient's blood t determine their presence.

THE INTESTINAL GROUP OF DISEASES.

1. Typhoid and paratyphoid fever, cholera, and amoebic an bacillary dysentery form a group of intestinal infections in whic the causative micro-organisms are discharged with the excreta an gain access to healthy persons through the mouth. The gener principles of their prevention are practically identical. The firs effort made should be to destroy the infectious agents at the sourc namely, in the discharges from the intestine. The next effort shoul be to control the water and food supply and the personal habits c the men, so that any of the micro-organisms which escape destruc tion may not find their way into the digestive tract in a livin condition.

2. No man should be employed as cook or handler of food or wate who is a carrier of B typhosus, B paratyphosus "A" or "B," c cysts of entamoeba histolytica.

3. Stools of all cooks and food handlers (including handlers c water and drivers of water and ice wagons) will be examined fo typhoid, paratyphoid "A" and "B", and dysentery bacilli, and fo cysts of entamoeba histolytica. In case of enlisted men, notatio of positive findings should be made on the service record.

EPIDEMIC MENINGITIS.

Names.—Epidemic meningitis, or cerebrospinal meningitis, c cerebrospinal fever is one disease. In certain epidemics hemorrhag into the skin are common; because of this fact the disease is als called spotted fever.

Cause.—The bacterial cause of epidemic meningitis is a diplo coccus called meningococcus. It is present in the inflamed mem branes of meninges about the brain and spinal cord and within th ventricles of the brain of those ill of the disease. It is also prese upon the mucous membranes of the nose and throat of the ill, an even of the well, who act as healthy carriers of the diplococcus.

Sporadic cases.—Epidemic meningitis has not been absent fro this country as a whole in many years. The severe epidemics hav practically disappeared, but occasional or sporadic cases have neve less continued to arise. From time to time groups of cases or all local epidemics have also appeared.

Carriers.—The healthy carriers of the meningococcus are more merous than the cases of the disease which arise. The persistence the sporadic cases indicates, therefore, the continued existence of h carriers in the general population. The assembling of large oups of men from various parts of the country is certain to introce carriers, and the close association of the carrier with other pers is as certain to lead to the appearance of cases of epidemic ningitis.

Mode of infection.—Infection with the meningococcus takes place way of the mucous membrane of the nose and throat. Even en meningitis does not arise the carriers harbor the diplococcus on those mucous membranes. They are present also in their retions and gain access to others through coughing, sneezing, wking and spitting, and through contact of the hands contamited with the secretions.

Sources of danger.—The ill patient is a source of danger only to attendants, because he is kept isolated in bed. To reduce this nger to a minimum every precaution should be taken to disinfect destroy the discharges from the nose and throat. This is necessary marily in the interest of the attendants—doctors and nurses— l secondarily, in the interests of others, since doctor or nurse y be converted into a carrier.

The chief danger to others is the healthy carrier, because he is t suspected or isolated and moves about freely. He can be deted by means of a bacteriological examination, and having been tected, methods exist for ridding the mucous membranes of the lococcus.

The occurrence of a case of epidemic meningitis in a barrack, tent, mess is the signal for the bacteriological examination of all the n in this group. Until this is done, the men should not be pertted to move about freely. All those not found to be carriers can at once released. The others are released as soon as they become ningococcus free. Likewise the convalescent patient is not resed until a bacteriological examination has shown the mucous mbranes of the nose and throat to be free of the meningococcus.

Varieties of cases.—Two main clinical varieties of epidemic meninis occur. They are called ordinary and fulminating or explosive. the former the symptoms come on and develop gradually, and th or recovery is a matter of one or several weeks. In the latter symptoms appear suddenly and quickly become alarming, and th may result in a few hours and usually does occur within 36 urs. The greatest number of recoveries occur among the ordinary es, but recovery has been observed even among the fulminant es. Recovery from both is now more frequent as the result of use of the antimeningococcic serum.

Prevention.—No certain means of prevention of epidemic meninis is known except the detection and removal of carriers of the ningococcus and the isolation of cases of the disease. The incince of the disease is, however, influenced by hygienic conditions. e greatest number of cases tends to occur in the winter when ople are much indoors and ventilation is deficient. In the spring, mmer, and autumn, when they live less within doors, fewer cases

arise. Hence, the appearance of the disease in camps is an indic
tion for better separation of the inmates. The less they are in int
mate contact, the smaller the danger from coughing, hawking, an
spitting except under conditions in which the secretions can be caugh
as in a handkerchief. Cleanliness of person, especially of the hand
is also a safeguard.

Treatment.—The treatment most relied upon consists in the inje
tion into the membranes of the spinal cord and brain of the ant
meningococcic serum. This is done by means of lumbar punctur
a certain quantity of the cerebrospinal fluid first being remove
This fluid, which normally is perfectly clear, becomes turbid or pur
lent as a result of the infection and contains the meningococcus an
leukocytes and other cells. The diplococci are partly within an
partly without the leukocytes. Removal of the cerebrospinal flu
is of benefit because it withdraws a certain number of meningococ
but it also reduces the pressure within the ventricles of the brai
which is of value. The antimeningococcic serum acts directly upo
the diplococci, destroys them or prevents their multiplicatio
Hence, it is definitely curative.

The serum acts only as long as it is within the meninges or mem
branes of the spinal cord and brain, and as it escapes into the bloo
its injection must be repeated. The rule is to repeat the injectio
every 24 hours for two or three or more days. In severe cases
has been found of advantage to repeat the injection every 12 hour
The detailed methods of employing the serum and of treating carrie
are given in a special circular.

MALARIA.

Cause.—Malaria is caused by a microorganism (plasmodium m
lariae) which gains access to the body through the bites of mosquito
belonging to the genus Anopheles.

The predisposing causes of the disease are those that favor t
development of mosquito life.

On account of the nocturnal habits of the malaria-bearing mosqu
toes, the disease is more likely to be contracted at night.

Prevention.—Camps should not be located near swamps, or
places where standing water favors the development of the mosquit
Every precaution will be taken to destroy breeding places by drai
ing and filling, or by oiling them and by the cutting away of all gra
or undergrowth for a distance of 200 yards about camps and habit
tions in order that the adult mosquitoes may not find lodgment an
protection.

In certain conditions the use of preventive doses of quinine may
required, and administered by order under the supervision of t
medical officer. All cases of malaria will be promptly isolated f
treatment and protected from the attack of mosquitoes.

(See also par. 192–194, Manual for the Medical Department.)

YELLOW FEVER.

Is transmitted by the bite of the yellow fever mosquito (stegomy
calopus).

Yellow fever is essentially a disease of the Tropics and its existen
is dependent upon the distribution of this single species of mosquit

all and silver-striped, active principally at evening time, and eeding generally in small accumulations of water close to the bitations of man.

The prevention of this disease, as of malaria, depends chiefly on e destruction of the mosquito and its breeding places, the proper otection against the bites of the insects at all times, and the early lation, protection, and treatment of each case of yellow fever as on as suspected.

TYPHUS FEVER.

Definition.—Typhus fever is an acute infectious disease, caused a specific germ, characterized by sudden onset, high fever, marked rvous symptoms, and macular eruption. It has prevailed in exico and in eastern Europe since the middle of the sixteenth ntury.

Transmission.—Typhus fever is transmitted to man only by the te of the louse, which infests the clothing and body of the victims.

Prevention.—The prevention of typhus fever depends, therefore, on personal cleanliness and the avoidance and destruction of fected lice.

Frequent bathing and cleansing of clothing, with repeated inspecons of garments, particularly the seams where the eggs of the louse e deposited, are imperative precautions.

The clothes louse lays its eggs among and attached to the fibers of othes with a special preference for seams and linings, a point to be membered in the destruction of lice.

The eggs are the size of a pin-point, yellowish white in color, gobletaped, and attached at the lower end to the cloth by a cement creted by the female. They can be destroyed by boiling water or rosene. In this connection see Bulletin No. 10. War Department, 16.

The avoidance of buildings, places, and persons known to be incted with lice is of first importance.

In case troops are sent into a typhus area, a railway disinfecting d bathing train will be provided and stationary plants of like aracter at the bases.

EPIDEMIC JAUNDICE.

Cause.—Epidemic jaundice is caused by a spirochete which is undant in the urine and feces of convalescents, and is also frequently und in the kidneys of rats. This spirochete lives for some time in ater, and the disease is contracted by standing in contaminated ater, and less frequently by eating contaminated food.

Prevention.—Prevention consists in isolation of all cases until the ine and feces are free from spirochetes, avoidance of urine and cal contamination of trenches, destruction of rats, the protection food, and keeping trenches free from water. If the trenches come contaminated, water should be pumped out and lime inkled freely over the soil.

SMALLPOX.

Any case of smallpox occurring among persons subject to milita control will be isolated, and contacts not protected by recent succe ful vaccination will be revaccinated.

VACCINATION.

Vaccination being recognized as an effective means of preventi smallpox, all recruits upon enlistment and all soldiers upon reenlis ment will be vaccinated. When the first vaccination of a recru is ineffective, it will be repeated at the end of eight days.

All the personnel of a military command, station, or transpo including civilians connected therewith, will be vaccinated when the opinion of the medical officer responsible for sanitation it necessary as a means of protection against smallpox. Civilians r fusing to be vaccinated when so directed by proper authority may excluded from the military reservation or station.

Officers should be vaccinated at least once in a period of sev years. Troops under orders to perform over-sea journeys or fie service will be inspected by the responsible medical officer wi respect to their protection against smallpox, and those who in h opinion require it will be vaccinated.

Technique.—The skin at the selected site must be clean. Washi with warm water, followed by alcohol, is usually sufficient, the alcoh being permitted to evaporate before proceeding. Scrubbing wi soap and water is necessary for a dirty skin, but needless irritation the skin is to be avoided.

The proceedure, described as follows, is preferable to "scarific tion," which will no longer be used:

Incision is the method of choice and should be made with the poi of a sterile needle, producing a "scratch." A sterile scalpel may b used, but is more likely to cause bleeding. The incision or scratc should preferably not draw blood. There should be at least tw incisions, three-quarters of an inch long and 1 inch apart; aft exposure to smallpox four incisions will be made. The virus is th placed upon the abraded surface and gently rubbed in, unnecessar irritation being avoided.

The wound is allowed to dry thoroughly and can be left witho dressing, though several layers of gauze may be applied with adhesi plaster. Any dressing that retains heat and moisture is bad. Shiel will no longer be issued.

Bathing is permitted, but unnecessary use of the limb is to b discouraged when practicable.

MEASLES, MUMPS, AND SCARLET FEVER.

When these diseases appear in a command all cases of illness wi catarrhal symptoms having a temperature of 101 degrees or ov will be promptly isolated, and the general preventive measures use against the contagious respiratory diseases will be instituted. Su ceptible contacts will be isolated and inspected daily.

If practicable, a detention camp will be established where a recently joined recruits will be held under observation before bein permitted to join their organizations.

SANITATION, UNITED STATES.

CAMP SANITATION.

The following sanitary regulations are published for the guidance all concerned:

1. *Responsibility for sanitation.*—Commanders of all grades are responsible for police id sanitation and for the enforcement of the provisions of these regulations within eir organizations.

2. *Division surgeon.*—The division surgeon is charged, under the commanding gen- al, with the general conduct and supervision of the Medical Department of the vision in the performance of its duties and will make recommendation concerning l matters pertaining to the sanitary welfare of the command.

3. *Sanitary inspector.*—The sanitary inspector is assistant to the division surgeon id is charged especially with the supervision of the sanitation of the command to hich he is assigned. It is the duty of organization commanders to remedy defects ported to them with the least possible delay.

4. *Sanitary squads* will be organized by the division surgeon for special sanitary irposes, such as the purification of water supplies, mosquito and fly prevention, dis- osal of wastes, and disinfection. They will consist of officers, noncommissioned offi- rs and privates first class, or privates of the Medical Department, assisted by civilian nitary laborers employed by the Quartermaster Corps, and when necessary by tails of officers and enlisted men from other branches of the service.

5. *Water supply.*—In the field water must not be used for drinking purposes until has been pronounced fit for use by a medical officer. Care must be taken to prevent ntamination of stored water by keeping all containers scrupulously clean and vered in such manner as to prevent "dipping," and the entrance of dust and other urces of infection. The use of a common drinking cup will not be permitted.

An appliance carried on the supply table as "Water bag, field, sterilizing," consists a 40-gallon canvas bag of specially woven flax, 20 inches in diameter and 28 inches length. The purpose of the bag is not to transport water, but to provide a stationary ceptacle in which water can be held long enough to sterilize, and then be distributed. ie empty bag weighs from 7 to 7½ pounds and folds into a convenient package for rriage in the field, for which purpose it was especially designed. After the bag is spended and filled, the water is sterilized by the addition of a small amount of pochlorite of calcium. This is carried in measured doses, sealed in glass tubes. ie process is one of oxidation. In the strength used, waters highly infected are ndered safe. Water ordinarily used will be entirely safe after being so treated. As e chemical acts more efficiently in clear waters, a filter cloth, to be fastened over e opening of the bag and weighing 1 ounce is provided, or water may be strained rough a blanket. Suspended matter, such as clay, is largely removed and not left interfere with the action of the chlorin. The bag is filled after it is put in place.

6. *Kitchens and mess halls.*—Kitchens and mess halls will be securely screened and traps provided for catching flies that gain entrance. An effective flytrap con- ting of a light wooden frame covered with wire gauze, extending to about one-eighth an inch of the floor of the trap, is readily constructed. Sweetened water, slightly idulated with vinegar, is an excellent bait. Fly paper may also be used. All food ceptacles, dishes, and tableware will be protected from flies and dust. Unit com- inders will see that an ample supply of hot water and dish towels are provided for eaning cooking utensils, dishes, and mess kits. Ice boxes will be kept elevated at height sufficient to allow for inspection and cleansing. Drip pans will be emptied d scalded out daily.

7. *Food and drinks.*—No food or like commodities will be sold in camp except in e authorized exchanges.

Bills of fare should be prepared in advance and adhered to as far as is practicable. Attention is called to the use of the following foods, the elimination of which from e messes will serve to prevent a variety of intestinal disorders:

(a) Canned milk and fish opened the day before (milk and fish poisoning).

(b) Hashes of meats and potatoes prepared the night previous (ptomaine posioni of severe type).

(c) In certain localities green vegetables, uncooked (dysenteries and diarrhea).

8. *Baths and lavatories.*—Careful inspection will be made daily to see that wa water is so disposed of as to prevent mosquito breeding and other nuisances.

9. *Disposal of garbage.*—For detachments or companies in camps or in isolated lo tions where other means of disposal are not available, an incinerator will be install of a type approved by the sanitary inspector. The Guthrie incinerator may be use detail drawing for the construction of which may be found in the Manual for t Quartermaster Corps. Where disposal in a sanitary manner can be made by carta the garbage may be carried away in the can and disposed of. The returned can w be thoroughly cleansed. Cans will be kept tightly covered on open stands.

10. *Care of picket lines and disposal of manure.*—Picket lines will be kept broo swept, and all manure and straw hauled away daily and burned or otherwise dispos of as directed by the sanitary inspector. A weekly incineration of the picket li will be accomplished with the use of crude oil. Crude oil may be obtained from t Quartermaster Corps on usual requisition.

11. *Disposal of excreta.*—In permanent camps where a water-carriage system not installed, the Havard or other fly-tight box and pit latrine will be used. Ea day the pit will either be burned out or sprayed with a lampblack or bone-bla mixture. If burned out, 1 gallon of crude oil and 15 pounds of hay or straw shou be used. A satisfactory mixture for spraying consists of half pound of lampbla to a gallon of kerosene, or 1 pound of bone black to 3 gallons of crude oil. Sprayi should be done preferably with a spray pump. Both the interior of the box a of the pit should be kept thoroughly coated with the mixture. Detail drawing the Havard box may be found in the Manual for the Quartermaster Corps. T box must be kept fly tight. This implies closure of all cracks, care of hinges, a back construction, so that the lids drop automatically. The latrine seats will scrubbed with soap and water daily and washed off at least twice weekly with a o one-hundredths solution of creolin or other disinfectant. When filled to within feet of the top, pits will be filled with earth to within 6 inches of the surface a covered with a layer of sacking soaked in crude oil to extend 3 feet beyond the edg of the pit; the latter will then be filled in with earth and the location marked. Urin cans will be placed in the camp streets at nights and removed in the morning, emptie and burned out. Facilities for washing the hands should, if possible, be provid in each latrine.

12. *Personal cleanliness.*—Every member of the command will bathe at least twi weekly. Army Regulations (par. 286) require that the men shall wash their han before each meal and immediately after visiting the latrines. Teeth will be cleans with a brush at least once a day. Underwear should be frequently changed. Be ding and clothing will be sunned and tent walls raised daily, weather permittin Barracks and tents will be adequately ventilated. Tents will be furled or stru frequently so that the sites may be thoroughly sunned.

13. *Venereal diseases.*—The cause of these diseases is a matter of common know edge. They are entirely preventable and the Government punishes those who expo themselves and contract venereal disease by prompt stoppage of pay and restricti of privileges while under treatment.

It is enjoined upon all officers serving with troops to do their utmost to encoura healthful exercises and physical recreation and to supply opportunities for clean social and interesting mental occupations for the men under their command; take advantage of favorable opportunities to point out, particularly to the young men, the inevitable misery and disaster which follow upon intemperance and mor uncleanliness, and that venereal disease, which is almost sure to follow licentio living, is never a trivial affair. Although the chief obligation and responsibili for the instruction of soldiers in these matters rests upon company officers, the medic officers should cooperate by occasional lectures or other instruction upon the su ject of sexual physiology and hygiene and the dangers of venereal infection.

Commanding officers will require that men who expose themselves to the dang of contracting venereal disease shall at once upon their return to camp or garris report to the hospital or dispensary for the application of such cleansing and pr phylactic treatment as may be prescribed by the Surgeon General. Any soldi who fails to comply with such instructions, if found to be suffering from a venere affection shall be brought to trial by court-martial for neglect of duty.

Cases of these diseases will be promptly subjected to treatment, but not necessari excused from duty unless, in the opinion of the surgeon, it is deemed desirabl They will be made of record in the medical reports in any case. A list of those di eased but doing duty will be kept both by the company or detachment command and the surgeon, and the infected men will be required to report to a medical offic systematic treatment until cured. While in the infectious stages the men should confined strictly to the limits of the post. When a venereal case, whether or not sick report, is transferred to another command, the surgeon will send a transfer giving a brief history of the case.

14. *Fitting of shoes and care of feet.*—Company commanders will personally measure feet and fit the shoes of men of their commands and will be held responsible that instructions herein contained are strictly followed.

All measurements prescribed herein will be taken with the soldier standing in re feet and with a 40-pound burden on his back, bearing the entire weight upon foot to be measured. Balance may be preserved by resting the hand on a fixed ject. The measurements of the foot, which must be taken to make suitable eliminary selection of the shoe to try on, (*a*) the length, (*b*) the circumference ound the ball.

To measure the length, the soldier will stand with foot upon the foot measure, nished by the Quartermaster's Corps, fitted in a slot in a board, the heel of the dier fitting snugly against the heel block. The movale block will then be shed up until it touches the end of the great toe. The scale on the top of the oe will be determined, approximately, by adding 2 to the reading of the scale; us, if the soldier's foot scales 6½, a shoe not smaller than 8½ should be tried on first.

To take the ball measure, pass the foot tape, supplied by the Quartermaster's rps, around the foot at the prominent tubercle at the base of the great toe and the ominent tubercle at the base of the little toe.

The tape should lie closely to the flesh, but should not be so tight as to compress it. aving taken the foregoing measurements, the shoe best suited to the foot will be termined by reference to Special Regulations No. 40, War Department. For ample, assume that the circumference of the ball is found to be 9½ inches. In the ble on page 28 of the aforesaid circular, under the heading "Marching shoes," it ll be seen that for a foot requiring an 8½ shoe a ball measurement of 9½ inches corsponds to a D width. The size of shoe to try on for actual fitting is, then, in this se, 8½ D.

If the ball measurement found as above does not correspond exactly with any ball easurement given in the table, then the narrower of the two widths between which e measurement lies should be selected.

Beginning with the size and width thus tentatively selected, shoes will be tried on until atisfactory fit is secured.

Correct fit in width and instep will be determined experimentally. To determine e fact of fit the shoe will be laced snugly and the soldier with a 40-pound burden on his back will again throw his entire weight on one foot. The officer will then ess in the leather of the shoe in front of the toes to determine the existence of fficient vacant space in front of the great toe be less than two-thirds inch, nor should ere be pressure on the top of the toes. The officer will then grasp with his hand e leather of the shoe over the ball. As his fingers and thumb are brought slowly gether over the leather the shoe should feel snugly filled without apparent tension hile the leather should lie smoothly under the hand. If the leather wrinkles under e grasp of the hand the shoe is too wide and a narrower width is needed; if the ather seems tense and bulging and the hand tends to slip over easily, the shoe is narrow and a greater width is necessary.

Usually it will be necessary to try on several pairs of shoes in this manner before entirely satisfactory shoe is secured. A record of the proper size and width of oes as determined above will be kept as provided in Circular 17, Quartermaster eneral's Office, May 1, 1916.

Measurements will be taken and shoes will be fitted as prescribed at least once in ch enlistment and the record will be changed from time to time if subsequent tings render a change necessary.

Sizes called for in requisitions will conform to the record and the fact of fit of oes issued on such requisitions will be personally verified in every instance by mpany commanders in the manner above prescribed.

No shoes will be issued to, or worn by, enlisted men while on duty which are not ted in accordance with this order.

New shoes should be adapted to the contours of the feet as soon as possible. Shoe etchers with adjustable knobs to take pressure off painful corns and bunions are sued by the Quartermaster Corps.

All shoes should be properly broken in before beginning a march. The following required:

The soldier stands in his new shoes in about 2½ inches of water for about five minutes ntil the leather is thoroughly pliable and moist; he should then walk over for about an our on a level surface, letting the shoes dry on his feet, to the irregularities of which the leather is thus molded in the same way as it was previously molded over the s last. On taking the shoes off a very little neat's-foot oil should be rubbed into leather to prevent its hardening and cracking. If it is desired to waterproof the sh at any time a considerable amount of neat's-foot oil should be rubbed into the leatl

Light woolen or heavy woolen socks will habitually be worn for marching; the so will be large enough to permit free movement of the toes, but not so loose as to per of wrinkling. Darned socks, or socks with holes, will not be worn in marching

Company commanders, by frequent inspections throughout the year, will maint the feet of their men in condition for proper marching. They will cause the pr trimming of nails, removal or paring of corns and callouses, relief of painful buni treatment of ingrowing nails, and other defects, sending serious cases to the surge

Before a march is undertaken by foot troops, company commanders will person inspect the bare feet of their men. While on the march they will personally see e day that their men wash their feet as soon as possible after reaching camp, p and evacuate blisters and cover such blisters or excoriations with zinc oxide pla supplied by the Medical Department, applied hot, dust the feet with the foot pow supplied by the Medical Department, and put on clean socks. An undue amo of foot injury and disability from shoes will be regarded as evidence of inefficie on the part of the officers concerned and as cause for investigation.

Quartermasters will provide a place where shoes may be fitted for the purpos determining or verifying the record to be kept in each company, troop, battery, detachment of the proper sizes of shoes required for each enlisted man thereof. the purpose of fitting they will keep on hand at all times a complete series of e size and width of shoes furnished for issue. Company commanders will report writing to the next higher commander every instance of failure to secure proper sh for their commands or to obtain proper facilities for fitting the shoes as herein direct Commanders will investigate the reasons for and be held responsible as far as lies their power for the rectification of such deficiencies.

A brief record of the number of such reports from company commanders and reason for such deficiencies will be furnished to inspectors at each inspection.

Inspections conducted under the provisions of paragraph 889, Army Regulatio will embrace an inquiry into the manner in which this order has been complied wi and the report of inspections will include a statement of all instances of failure on part of company commanders to secure proper shoes for their commands and the ca of such failure.

15. *Physical inspections of troops.*—Commanding officers will require a medi officer, accompanied by the company or detachment commander, to make a thoro physical inspection twice in each month of all the enlisted men of each organizat belonging to or attached to the command. These inspections will be made at tin not known beforehand to the men and preferably immediately after a formati The dates on which the physical inspections of the various organizations are made v be noted on the monthly sanitary reports.

At these inspections an examination of the feet and footwear and of the condition personal cleanliness of the men will be made, as well as careful observation for t detection of venereal diseases.

16. *Sanitary inspections of organizations.*—Surgeons of organizations will mak daily inspection of the commands to which they pertain, giving particular attention the following: Picket lines, latrines, kitchens, and mess halls, including cleanlin of cooks, utensils and fixtures, barracks and tents, inclosed toilets, baths, lavator laundries, exchanges, garbage receptacles, incinerators, and all food supplies. Th will make a verbal report at once to their respective commanding officers for t correction of any sanitary defects noted, and a similar report, with the action taken, the sanitary inspector on his next visit.

17. *Mosquito breeding.*—Areas about camps in which mosquitoes might breed, su as cisterns, tanks, woods, gutters, pools, and drains, will be kept under close obser tion by the responsible medical officers and the proper remedies applied, i. e., scre ing, draining, oiling, etc. The use of the mosquito bar is imperative in all distri where mosquitoes are prevalent, except where tents or barracks are effectua screened with wire.

18. *Flies.*—All possible breeding places of flies should be destroyed, particu attention being given to manure and refuse from picket lines and stables.

An energetic campaign must be begun at once against the mature flies.

REPORTS OF DEPARTMENT SURGEONS.

The department surgeon, Eastern Department, reports as follow

The average strength of command as reported by surgeons, was 23,013. The numb of admissions to sick report, including those taken up for record only, was 18,410, a

2 were made from the previous year; no deduction was made for readmissions. The lmission rate per thousand of strength for 1915 was 757.22. the admission rate for this ear being 799.98. The admission rate for the entire Army in the year 1915 was 726.19, admissions deducted.

The constantly noneffective rate for all causes, per thousand of strength, was 22.09. he rate for 1915 was 19.35, for 1914, 17.69, and for 1913, 16.52. These increases are counted for partly by the increase in the garrison at Panama, where a higher conantly noneffective rate is expected, and by the withdrawal of troops from posts in is department, leaving their sick to be cared for, thus charging this department with e days lost by such patients without the compensation of the organization strength be used in statistical tables.

The average number of days each case was treated was 9.79, an increase over that of st year, which was 8.86; and for each case of venereal disease an increase from 12.53 1915 to 14.08 in 1916. This increase is due at least in part to the fact that surgeons posts are required to keep active cases of venereal disease in hospital wherever racticable. The percentage of venereal admissions to all cases was 13.75, as contrasted ith 12.22 for 1915.

With reference to venereal diseases, the rate of constantly noneffective of the epartment for the year was 4.16 against 3.39 for 1915. The admission rate for venereal iseases per thousand of strength was 109, as against 97 in 1915 and 99 in 1914. No eduction is made on readmissions.

The eight prevailing diseases in order of precedence after venereal are as follows:

Disease.	Days lost.	Constantly noneffective per thousand of strength.
Digestive	19,258	2.28
Cutaneous	12,897	1.53
Respiratory	11,320	1.34
Circulatory	7,979	.95
Malaria	7,379	.88
Influenza	7,342	.87
Tonsilitis	5,912	.70
Rheumatism	5,732	.68

EPIDEMIC DISEASES.

Mumps.—There were only 51 cases of mumps, losing 869 days, as compared with 5 cases in 1915, which lost 29,506 days. These cases occurred at 15 posts, the largest umber, 20, having occurred at Fort H. G. Wright.

Measles.—There were 110 cases of measles at 29 posts, losing 1,925 days, as compared ith 45 cases in 1915, losing 832 days. The largest number was 15 cases at Fort Adams.

Typhoid fever.—There were 2 cases of typhoid fever during the year, 1 at Fort ade and 1 at Fort Oglethorpe.

Tuberculosis.—A decrease is noted from last year, as shown by the following table:

1914	41 cases lost 1,152 days.
1915	77 cases lost 1,568 days.
1916	65 cases lost 1,334 days.

The largest number of cases, 8, occurred at San Juan; Fort Myer and camp at Empire ch had 5 cases.

Alcoholism.—The following table shows the number of days lost, admissions, and ys lost per thousand of strength on account of alcoholism:

Year.	Days lost.	Number of admissions.	Admission rate per thousand.
3	1,651	388	17.02
4	1,283	362	16.12
5	1,992	446	16.80
6	1,607	375	15.28

Leprosy.—One case of leprosy in the person of a hospital matron occurred duri the year at Key West Barracks. The source of infection is not known.

During the year, 196 soldiers belonging to this department were discharged surgeon's certificate of disability. Of these, 83 were for causes incurred in line of du 113 were for causes not in line of duty. Of the latter, 73 were for disability existi prior to enlistment. The rate per thousand of strength is 8.52 as contrasted with 6. for 1915 and 10.42 for 1914. The rates of discharge in the Army at large in 1915 a 1914 were 13.60 and 14.82, respectively.

Discharges on surgeon's certificate of disability, calendar year 1916.

The unsatisfactory condition in the matter of hospital treatment in the Canal Zone those in the military service, and more particularly for the dependent members the families of persons in the military service, has been brought to the attention higher authority in previous reports. No change in the condition has occurred ring the year. A hospital or hospitals in the Zone for the treatment of the sick of military service, to be controlled, managed, and served by members of the Medical partment only, and the withdrawal of medical officers from the civil or Canal hosals, would seem to be the only satisfactory solution of the present difficult situation.

Hospital fund.—As shown by the monthly statements, the hospital fund has been ll administered, and the various messes efficiently and economically managed.

When the school for bakers and cooks is reestablished at Washington Barracks it is intention of this office to encourage the assignment of prospective cooks and mess geants from the larger posts for assignment to that school for the course of instruction. One acting cook was sent to the school from Fort Monroe in the early part of the ar. Subsequent records show that he was sent to Plattsburg with a section of the ool, and finally was discovered acting as kitchen police in one of the engineer comnies. It is presumed that in more settled times a repetition of this incident will t occur.

Sanitary inspections.—No sanitary inspections were made during the year. The erdiction of the War Department of July 8, 1915, has not been lifted and no special nditions have arisen that required investigation.

Medical officers in different parts of the country have been designated to assist the spector general's department in the inspection of sanitary units and sanitary detachents of organizations of the National Guard at the winter armory inspections. The ports of their work do not reach this office.

Dentists.—There are serving at present in the continental limits of this department e dental surgeons, with an estimated strength of about 15,000 men. There should at least 15, and an additional dentist sent for every regiment which may be returned station from the border.

There are three serving in Panama, and one is under orders from Columbus Barracks San Juan for a limited period.

The situation will be much relieved if all of the dentists sent from this department temporary duty to the Texas border can be returned to their proper stations.

There are allotted to this department 157 medical officers and 21 dentists, as follows:

lonels	1
eutenant colonels	10
ajors	38
ptains	44
rst lieutenants, Medical Corps	3
rst lieutenants, Medical Reserve Corps	60
ntract surgeon	1
Total medical officers	157
First lieutenants, Dental Corps	21

Of these, 76 medical officers are serving on the border on temporary duty with the uthern Department, and 10 of the 21 dentists are likewise on temporary duty with e Southern Department on the border.

The following is the standing of the enlisted personnel of the Medical Departmen this date:

Sergeants, first class	
Sergeants	
Corporals	
Total	1

Allowance, 123; excess, 3.

Privates, first class (including cooks)	2
Privates	3
Total	5

Allowance, 553; deficit, 24.
The number of cooks is 37.

The personnel at Fort Crockett is not included in this table, the post only havi been retransferred to this department on December 14, 1916.

The services of the officers of the Medical Reserve Corps and of the Dental Cor have been entirely satisfactory, no complaints or disciplinary measures taken havi been reported to these headquarters.

Detachments, Medical Department.—The establishment of ratings for increased p for surgical assistants, dispensary assistants, and nurses will, it is believed, result much satisfaction to those members of the Medical Department who have merit such ratings and will insure the Government better performance of those duties.

The machinery for conferring these ratings upon the men is believed to be cu bersome, and in the opinion of the undersigned a better plan would be for the depar ment surgeon, or the Surgeon General in the case of those posts which are independen to definitely determine how many of each grade shall be allowed to the various ho pitals, and then allow the surgeon of each hospital to rate or disrate, according to t merits of the case. The provision that the men are not to receive the pay excepti when actually performing the duties, is a very good one and should be continue Instruction of the men of these detachments has been followed as per the schem outlined in the Manual for the Medical Department.

This department was stripped to the lowest possible minimum of all instructed me when the mobilization of Regular troops to points on the border began in the early pa of the year. Recruits were sent to certain posts from recruit depots for intensi training, and in view of the urgency of the situation directions were given that the men receive at least six hours of drill and instruction per day. This method, conjunction with the excellent character of the recruits then being enlisted resulte in fairly well-equipped sanitary soldiers being available for transfer to the border a very short time.

The establishment of the higher grades of noncommissioned officers (master hospit sergeant and hospital sergeant) will doubtless result in making the noncommissione officers more satisfied with this branch of the service, and stimulate them to equi themselves for the higher duties. It is believed, however, that the change of the status by subjecting them to reductions by court-martial, and particularly by changin ranks so that the first sergeants of companies are senior to the sergeants first class of t Medical Department, is a mistake. It is believed that any person who has serve with troops will concede that a sergeant first class is of necessity of a higher grad than is needed for first sergeant, with the single exception, perhaps, of the contr and discipline of men, and even in this few of our older noncommissioned officers a lacking.

Extracts from Reports of Surgeons of Posts.

FORT CONSTITUTION.

The surgeon's quarters is the only building on the reservation receiving its wat supply from a ground well. Though situated on rock foundation, the latrines used b the militia organizations during their summer encampment and the location of stabl within about 100 feet of this building, make the water supplied by this well unsa for drinking purposes. The post hospital consists of a one-story frame buildin heated by coal stoves throughout. The dust and coal gas arising from the operatio of these stoves tend to make sanitary conditions at the hospital not altogether sati factory. There is only one washbowl and one bathtub available for use by men o duty and patients. The lighting facilities are also in need of improvement.

PLATTSBURG BARRACKS.

he toilet room adjoining the mess hall and bathroom in the general mess hall ıld be entirely remodeled and new fixtures installed. Screened doors should be alled between this room and the kitchen. These were recommended in 1914, but hange has yet been made. The shower bath can not be used. The room is deemed ınitary because the floor is in a very dilapidated condition, allowing fluids to leak ugh the basement.

FORT JAY, N. Y.

new hospital building is needed. This has been reported for many years. The ent one is poorly designed; creates an unfavorable impression upon visiting essional men; is not sanitary; has no waiting room or receiving room (officers, es, children, enlisted men, civilians, and prisoners assemble in the hallway iting their turn); no wardmasters' rooms, no isolation ward, no insane ward, no sroom, no special room for the removal of serious or dying cases, no toilets except vards, and no suitable examination room. The plumbing is practically worn out there is no hot water in the main building. The hospital at present is being used n evacuation hospital for the military in Panama, as well as for general prisoners, itia, and casuals from New York City, as well as cases sent from other posts in this artment for observation and treatment.

FORT WASHINGTON, MD.

his post formerly had the unenviable distinction of having the highest rate in the ıy for malarial disease. During the year 1916 the few cases of malaria under tment there did not originate at that post. The vegetation has been kept down, ns cleaned to prevent breeding and harboring of mosquitos, swampy places have n drained or oiled by post labor, and a number of goats maintained to keep down vegetation.

FORT WARREN, MASS.

he prevailing diseases, influenza and tonsillitis, are believed by the surgeon to be in a considerable measure to the poor ventilation and uneven heating of the emate quarters and of the old temporary barracks used as quarters by a part of the ımand. The only remedy is reconstructing the entire post. The sanitary defects cerning the stables remain unchanged. Construction of concrete floors is deemed essary.

FORT HOWARD, MD.

he following interesting quotations are made from the report of the surgeon at t Howard, with relation to gonorrhea, concrete barracks, and the presence of s and mosquitos:

Gonorrhoea—while not in as great a percentage as would probably be found ng the same number of unmarried young men in civil life—is not an infrequent ıplaint. The prophylactic treatments are required and records of such cases are t and 'K' packets are obtainable at post exchange and hospital for the asking; ertheless this procedure does not seem sufficient. In my opinion, the men are not ressed with the necessity of treatment immediately after exposure; i. e., a man may exposed several times within a few days and take but one treatment; then, if he elops gonorrhea within a week or 10 days after the recorded prophylactic treatıt, I have no proof that he did not conform to regulations if he does not choose to ıit it. I have tried to impress upon the men the advisability of the use of the ventative tubes and a lecture has recently been given to the enlisted personnel on subject.

All buildings with one exception are light and well ventilated. Plumbing and inage in good condition. The exception is a concrete barracks building that is ng a great deal of trouble. The men complain of colds and discomfort. The lding is always damp and on frequent occasions the walls 'sweat' moisture, with dles of water on the floor. I reported these conditions to the commanding officer, called a board of officers for investigation. This board made an exhaustive study his building and its findings and recommendations were forwarded to higher horities and a requisition for material to install wooden floors in these barracks likewise submitted.

The post is almost entirely surrounded by extensive tidewater marshes and the squitoes and flies present a very difficult problem. From May until October oil listributed every week. All drains, sewers, and hollows where water can collect

were also treated with oil. The marshes on the reservation are all ditched and
is distributed here also. This seemed to reduce the number of mosquitoes this su
mer, although it is an impossibility to eradicate them unless one had authority o
the marshes outside the post with unlimited money to spend. There were onl
few cases of malaria this year and practically all cases were old infections transplan
from some other place. The flies were present in great numbers, more especia
during the months of September and October. The garbage-disposal cans were m
carefully inspected and regulations rigidly enforced on the reservation, but the res
was far from satisfactory. This condition was due to a great extent to the insanit
condition of the settlement immediately outside of the reservation, which condit
is deplorable. Another cause is the fertilizer used on the truck farms in the immedi
vicinity. The settlement consists of about 50 houses, the owner of which owns m
of the land adjoining the reservation. He uses as a fertilizer the residue from
sewerage tanks of the Baltimore sewer disposal plant, and probably untreated hun
excreta, although there is no proof of this fact. This seems to attract and breed f
in great numbers. The settlement is drained by open ditches, only a few of wh
are cemented. Most of them are merely trenches without proper fall and unke
The grass and weeds are allowed to grow in them. The toilet facilities are woo
shacks all built on the edges of these ditches and each containing galvanized ca
Some attempt has been made to screen these cans from the flies in the past, but t
attempt was evidently inadequate in the beginning and long since has fallen i
decay. The cans are emptied at infrequent intervals and in many cases run ov
their contents running into the draining ditches. They are at all times exposed
flies. The main outflow ditch goes across the road immediately outside of the g
of the reservation and empties on the edge of the marsh that abuts on a deep arm
a creek which washes the shores of the reservation. There is a continuous 'scu
on this water around the shore line and in hot weather the odor is extremely unpleasa
although the condition has considerably improved over past years, according to repo
No way has been found to force the owner to remedy these conditions. Complai
to the State board of health brought back the answer that unless it could be pro
that these conditions actually caused a definite case of disease that they were pow
less to do anything. Most of the inhabitants of this settlement are enlisted men w
of course, could be ordered to live within the reservation. This would not discon
the owner, however, because the workmen of the Sparrows Point Steel Mills wo
promptly occupy the vacated houses. No recommendation is made with a view
remedying these conditions unless it be possible for the Government to buy the la
in question."

FORT DUPONT.

The surgeon reports venereal diseases rather in excess of the ordinary, owing to
fact that the men are exposed while on pass in Wilmington, and the time that elap
between exposure and prophylaxis is too long. The use of prophylactic tubes
such cases to be followed by the regular hospital treatment is recommended.
reference to the water supply, the surgeon states the presence of an excess of fe
salts in the water rapidly deteriorates the plumbing and necessitates an excess
expenditure for repairs. There is no other source available. Distilled water is u
for drinking and cooking.

FORT ETHAN ALLEN.

The surgeon, Fort Ethan Allen, reports the distance from the post to Burling
(the main source of infection from venereal disease) is probably the cause of
failure of the prophylactic in a few cases. He states his belief "that some kind
moving pictures could be used to advantage in the campaign against venereal disea
This has probably been suggested before, but it certainly is not impracticable to
one of the proper class. Some short story could be used as the framework for the m
facts, and a regular 'movie' company could put it on. It should include living p
tures of the insane, the blind, paralyzed, etc., due to these diseases, blocking out
facial expression in each case so as to avoid actual identification. When such films
completed, medical officers should be trained to give special explanatory rema
during the 'show,' using the chaplain's machine for that purpose." He also sugg
that recommendations be made that the next appropriation act provide for at le
$5 per month extra pay for chauffeurs of motor ambulances.

FORT ST. PHILIP, LA.

The surgeon reports that the hospital is absolutely unfit for laparotomy cases,
operating room being in a dirty condition, not from dirt that could be cleaned up
from dust in the cracks and crevices in the floor, etc., due to the age of the buildi

ch can not but be disturbed every time the floor is stepped upon. This condition ıld be extremely dangerous to a patient undergoing a bad abdominal operation ıuch a place.

FORT SHERMAN, CANAL ZONE.

'he surgeon reports in part as follows:

This post has always had numerous cases of malaria. This is because the post lf and surrounding areas are surrounded by jungle. The fact that the notoriously arial Chagres district is near by and that a detachment of this command has been ioned in the heart of this district added to the malarial rate. During the past r all swamps in and near the post have been drained and kept drained by over miles of ditches. The jungle is being cleared back as fast as possible.

There have been and still are many mosquitoes in the post at certain times when winds are from the south and southwest. These winds are especially prevalent ing the wet season, which lasts about eight months. The number of these mosqui-s, especially of the anopheles variety, is steadily growing less as we are able to rease the distance of the jungle from the post.

In view of all these facts it was recommended in the sanitary report for May, 1916, t enough jungle be cleared off so that it would be distant a minimum of a mile from quarters then occupied and about three-fourths of a mile from the new quarters templated (now under construction). This recommendation was repeated in the e report and was disapproved by a board for the time being.

It was later recommended, in a special sanitary report, that at least 350 acres of gle be cleared to give a minimum safety of one-half mile. To do this with the pres-help available would take the entire sanitary gang one year to accomplish if y were able to work exclusively at clearing jungle. With their other work to do vould take them two or three years, during which time the officers and enlisted n and their families would be exposed to bites from anopheles mosquitoes.

There were present in the post about 60 persons who are known to have had aria. These persons are kept continuously on quinine. Despite this we have ırrence among these cases. Also, mosquitoes get into the sleeping quarters despite fact that they are kept carefully screened. They enter through the doors when ned. Therefore if anopheles mosquitoes are present on the post with carriers, re will be more or less malaria. When the jungle area is pushed back far enough re will be practically no anopheles mosquitoes present in the post. The malarial has been constantly decreasing for the last six months in this post. Most of the es occurring are recurrences."

FORT RANDOLPH.

'he prevailing disease is malaria. Sanitary measures, including ditching and ining, have been carefully carried out, together with the prophylactic adminis-ion of quinine up to September 20, 1916. During the last five months no case of aria has originated at the post. Sand flies have been very numerous, especially ing May, when they became a source of extreme discomfort and a menace to lth. Since clearing and ditching part of the mainland and cutting grass and hes on the island the number of sand flies has been considerably reduced.

ixcept as above reported, the sanitary condition of all posts may be reported as d. At certain of the stations on the South Atlantic coast the only available supply drinking water is that obtained in cisterns, and no milk is purchasable excepting densed or evaporated milk. These conditions have been reported from year to r and, while not ideal, appear to be the cause of no particular departure from normal health of the command.

'he casemate barracks at Warren and Wadsworth have likewise frequently been orted upon, and, while they may be called dark, damp, and dismal, there has been outbreak of respiratory or rheumatic troubles at those posts out of proportion to those tations where troops are more comfortably quartered. The question of heating quarters of sergeants, first class, is still an annoying one for the noncommissioned cers stationed on the northern Atlantic coast and on the Great Lakes. In order nake the rooms habitable it is practically necessary to maintain a stove in each m. This is, of course, beyond the allowance of heating stoves and would be im-cticable with the present allowance of coal. If the quarters can not take advantage the hot-water or steam-heating plant already established in hospitals, then at st a satisfactory furnace which can economically heat the entire quarters should furnished.

Medical supplies have, as a rule, been abundant and good. The war in Europe caused a fabulous increase in the price of some commodities that were thought to indispensable, notably the potassium salts and the synthetic products from the Gern laboratories. The service is adjusting itself to the use of substitutes or other cla of remedies. The medical depots, while hard pushed during the mobilization, h with few exceptions filled requisitions with great promptitude.

THE MOBILIZATION OF THE NATIONAL GUARD.

The mobilization and muster into the Federal service of the National Guard Organized Militia were attended with much confusion, due to a number of cau Mobilization camps had been designated for each State prior to the issue of President's call. After the call in several States these sites were changed to ot points. In some instances organizations, instead of being sent to the State cam were rendezvoused at their armories or other points than those designated wh there were no facilities for caring for the sick. These changes had not been fores and consequently organizations did not receive supplies promptly. Blank fo necessary to the muster in were at first not available, and mustering officers w authorized to have them printed. In other instances blank forms sent from th headquarters to the mobilization camps were found on investigation to have remai in the post office.

Many of the Medical Department's units reached camp without supplies or w imperfect equipment and meager supplies. Their officers were ignorant of the met of procuring these and, pending the arrival of camp hospital equipment, purcha supplies in the open market. In some camps medicines were apparently most l ishly expended, timely requisitions to replenish them were not made, and supp were purchased in open market. In all such cases this office instructed the offi at fault in the proper method of procuring supplies and directed that in future tim requisitions be made for necessary supplies.

Camp hospitals had been sent by express by the Surgeon General of the Army each mobilization camp. In those instances where designated camp sites had b changed considerable delay in their delivery ensued in consequence. At a num of camps commanding officers of field hospital companies converted their field l pitals into camp hospitals for the care of the sick, thus immobilizing these un instead of using the camp hospitals for this purpose. It became necessary to is instructions from this office that these units were not to be immobilized, but w to be used for the purpose of instruction and training of their personnel, and that equipment of the camp hospitals which had been sent were to be used for the of the sick. Except at one or two camps these instructions were complied with.

Many of the medical officers of the National Guard, accustomed to the convenier and refinements of civil hospitals, failed to appreciate that the camp hospital eq ment was adapted to the treatment of practically all cases that might arise. T sent many cases to civil hospitals which should have been treated at the camp hospi On the other hand, the enlisted personnel of the Medical Department was inadeq and untrained, conditions which justified the transfer of serious cases to civil hospit Requests for the assignment of noncommissioned officers and men of the Med Department of the Regular Establishment could not be granted, none being availa Severe storms which blew down or rendered the tentage unserviceable, made trans of patients to civil hospitals necessary. The experience in camp hospital admi tration that might have been otherwise gained was thus lost to both the officers enlisted men.

In order to assist the examining surgeons in their various duties, and with the v of instructing the Medical Department personnel of the National Guard in th duties, one noncommissioned officer and two privates first class, or privates of regular Medical Department, were sent to each mobilization camp. It was assu that the National Guard organizations contained many men with clerical trai who after instruction would be able to take up this work. This assumption was realized, and these labors fell almost entirely upon the men so detailed. In s instances they were assigned by commanding officers to the camp hospitals as c and nurses. Requests were made for the assignment of noncommissioned officer instructors and privates as cooks, nurses, and clerks, but owing to the depleted dition of the Medical Department personnel in this department these requests c not be complied with. In each instance, the officer making the request was dire to instruct the National Guard personnel in such duties. It is believed no ser inconveniences resulted and the compulsory training of the medical departm detachments of the National Guard was of benefit to all concerned.

On June 22, 1916, a list of officers of the Medical Corps and Medical Reserve C available for assignment as examining surgeons at mobilization camps and post department was furnished the department commander by the War Department, the commanding general was authorized to assign the reserve officers to active y where required and to posts where necessary. Assignments were accordingly le from these headquarters. Some delay in the case of Medical Reserve Corps cers was occasioned by the fact that some were National Guard officers, others lined active service, and some could not be reached, but the majority promptly ponded. One officer of the Medical Corps, United States Army, was assigned each mobilization camp for duty as medical examiner and in charge of physical minations in mustering in militia into the service of the United States. Medical serve Corps officers were ordered to active duty and assigned to the camps as assist-s to the examining surgeons.

n two of the States in this department enlistments had not been made in accord-e with Bulletin No. 10, Surgeon General's Office, December, 1915, the United tes Army standard. In these, physical examinations were required to be made or to muster in. In the other States, troops were mustered in as soon as they had n accepted and were examined immediately after muster, and all who were found sically disqualified were discharged. The large number of discharges for disa-ty subsequent to muster in, varying from 25 to 50 per cent demonstrated that sical examinations of the National Guard had been very carelessly made, and that ional Guard officers with few exceptions had no conception of the physical quali-tions required. The commanding general was importuned in letters and telegrams aive physical defects in individual cases. This resulted in authorizing the regular lical officer at each camp to waive only such physical defects as would not interfere any way with the performance of all military duty. All physical examinations e made under the supervision of the regular medical officer. Instructions issued e to the effect that medical officers of the National Guard were to be the first mined, and after having been sworn and mustered in, were detailed to assist the lar medical officer. War Department instructions directed that physical exam-ions be hastened with the view of sending the troops to the border as soon as sible. In issuing these instructions, medical officers were directed to make these minations without regard to hours, and the work was then prosecuted day and t, in many instance for 16 hours or more each day, until completed. One er reported that he had not removed his clothing or shoes for 72 hours, and stopped y because he had reached a state of complete exhaustion. Under such circum-ces it was not surprising that many men who were physically disqualified for ice were passed. It was contemplated that the regular officer on duty at the ps should also act as the camp surgeon, a consideration, however, that was impracti-le, as upon him devolved the onerous task of deciding the question of the accept-e or rejection of every individual. Shortly after the troops arrived at the mobili-on camps, the War Department directed the commanding general to assign a medical er of no lower grade than that of major to each camp as sanitary inspector. There e absolutely no medical officers in the continental limits of the department for duty. In order to comply with these directions it became necessary to assign regular medical officer at each camp to this duty in addition to his other duties. ile it was appreciated in this office that it was imposing an impossible task upon , it was expected that he would at least be able to supervise this important duty ugh unable personally to make the inspections. The problem was solved in t camps by detailing a National Guard officer to make the actual inspections, reported defects to the regular officer.

n unfortunate situation developed in one of the States by reason of the fact that a nber of organizations were accepted and mustered in at their home armories instead t the mobilization camp, with the result that the examining surgeon assigned to mobilization camp was ordered to examine the organizations at various cities did not reach the camp until some time after its establishment. Unofficial orts of decidedly insanitary conditions in this camp led to the detail of a special itary inspector to investigate and report upon the conditions existing at this camp. succeeded in establishing order out of the chaos prevailing there, and in a short e thereafter the sanitary conditions were reported as satisfactory.

he muster in and dispatch of troops to the border were seriously embarrassed by relief of several of the senior medical officers before the completion of their duties everal of the camps. As there were no officers available to replace them, and as Department orders contemplated the presence of an officer of the Regular Estab-ment to supervise the work, and particularly to act as sanitary inspector, the lical work of the camp was delayed until officers at other camps had completed r work there and could be sent to replace them. In fact, in one State this duty essarily devolved upon an officer of the Medical Reserve Corps, although the

War Department had requested the assignment of medical officers of at least the of major.

The conscientious manner in which the duties connected with the muste were performed under most trying conditions and often with inadequate assista reflect great credit upon the medical officers and the Medical Reserve Corps offi engaged in them.

Considerable confusion was also occasioned by the issue of the new Manual the Medical Department after these officers reached the mobilization camps. S medical officers failed to receive their copies of this new manual. The designa of "camp surgeon" as used by the Surgeon General apparently was not spe enough to designate the regular medical officer for this duty at these camps, a many instances the commanding officer of the camp designated the senior mec officer of the National Guard as such.

Not being familiar with the designation "camp hospital," officers failed to ap ciate the purpose for which it was sent, with the result, in one instance, that its c ponents were distributed to the Medical Department organizations of the Nati Guard at the camp, and a field hospital, brought into the Federal service, wl probably was incomplete, was used as a camp hospital instead.

Some confusion and delay was also caused by instructions that finger print made, then that they be not made, and then again that they be made.

The blank forms used by the National Guard differ from each other in the var States, and all differ from those used in the regular service. Mustering officers, if any of whom had had previous experience in this duty, were unfamiliar with State blank forms and were in a quandary as to the form required for the muster the Federal service. Many of them failed to receive copies of the Mustering R lations. It would seem advantageous to require the National Guard to use ir administration the same forms as are used in the Army.

Owing to the large number of discharges for disability and other causes, recrui became necessary in order to bring organizations up to the required strength. ' service was performed by National Guard officers who had been mustered in for purpose. The unsatisfactory character of the recruits accepted was evidenced the fact that many were sent to hospitals for treatment almost immediately a acceptance. Recruit depot posts had been designated to which these recruits sent. In spite of this fact many cases were sent to civil hospitals for treatmer procedure that made large inroads upon the Medical Department appropriatior

Medical and hospital supplies were promptly issued from the depots, and in r instances were shipped by express. But one complaint was made to departn inspectors concerning inability to secure supplies. This complaint, upon inves tion in this office, was found to be based upon the fact that at this camp every mec officer in charge of a medical department detachment or unit felt free to make re sitions for medical supplies which obviously were disapproved in this office, instructions issued that requisitions should only be forwarded by the officer who been designated as camp surgeon.

In some of the States organizations brought no ambulances to the camps, w necessitated the hiring of conveyances to transport the sick and disabled cases w could not properly be cared for at the camp hospital from the camps to civil hospi

Vaccination against smallpox and typhoid fever was instituted as soon as the tr reached camp, vaccine having been promptly supplied on telegraphic request this office in all cases. Troops which were sent to the border prior to completic vaccinations were supplied with vaccine and instructions issued that vaccinatio completed en route or upon arrival, as might be indicated.

One case of smallpox occurred in one of the camps on one of our military rese tions. The senior medical officer of the Army on duty there very properly attem to vaccinate the entire personnel of the post, but met with the opposition of commanding officer, who protested to these headquarters against the proposed cedure. Telegraphic orders were promptly issued from these headquarters direc that every unprotected person upon the military reservation submit to vaccina and in the case of civilians who refused, that they be removed therefrom.

Two cases of typhoid fever, contracted prior to arrival at the camp, were rep at the mobilization camp, Moorehead City, N. C., and three cases, contracted to arrival at camp, were reported at the mobilization camp, Birmingham, Ala., one death from typhoid was reported at the mobilization camp, Nashville, T but so far as reports received in this office are concerned, no case occurred contact with these.

Among the troops first returned for muster out were three regiments of Infant New York State, which had suffered an outbreak of paratyphoid fever contract

llen, Tex. These regiments were, upon their return, encamped at Camp Whit-
n. A sanitary inspector was assigned to duty at this camp with instructions to
ch for all carriers and to supervise the work of vaccinating all the members of
command. To assist him in the work of identifying carriers, two Medical Reserve
ps officers, who are experts in this line of work, were assigned to active duty and
cted to report to him. The command was maintained in quarantine, the stools
very individual were examined, and those who developed the disease were trans-
ed to civil hospitals for care and treatment. The carriers were isolated and reported
he State board of health, in compliance with its request, in order that they might
p these cases under observation after muster out and their return to their homes,
revent spread of the disease to the communities to which the men returned. The
k was efficiently and expeditiously carried out with safety to the public. No
ension occurred among the troops after their return.

uch adverse comment was made because these troops were placed in camp during
l weather; steps were taken to provide floors for tents and to construct mess shelters.
wever, before this work was completed one regiment was mustered out at the
p and the others were sent to their armories; the sick were sent to the nearest
l hospital. After arrival at the armories, examinations were continued until all
been examined and cases of the disease disposed of as noted above; the muster
was then completed.

n view of the fact that inspector instructors and sergeant instructors had been
duty with the National Guard, it seems strange that there should have been so
ch difficulty experienced in making out the prescribed forms and in rendering
orts. In the simple matter of personal reports and changes of status, they either
lected to forward them, or incorrect reports were forwarded, entailing consider-
e correspondence from this office and the issue of circulars in order to obtain the
essary data concerning the personnel of the Medical Department in this de-
tment.

here also was almost universal ignorance of the proper method of purchasing
plies in emergency and of securing medical attendance and hospital care for the
who could not be cared for in camps, or who were taken sick while on detached
vice. Bills were sent into this office requesting payment without the necessary
chers, and one junior officer returned a letter of instructions concerning the
paration of vouchers, with the request that the blank be prepared in this office
h the necessary correction and that it be sent to the creditor for his signature.

he absence of the regular sanitary inspector from these headquarters was much
, and if there is to be another mobilization, it would seem essential that one, or
erably two, should be assigned here for the single purpose of making inspections
he Medical Department work and the sanitary conditions of the mobilization
ps. This inspection should be made at the earliest possible moment after the
val of troops and should be as comprehensive as possible. He should have power
orrect errors of sanitation of the Medical Department organization on the ground,
he name of the department commander. If possible, he should be accompanied
an experienced civilian clerk and a sergeant first class of considerable service
could instruct the noncommissioned officers in their clerical and administra-
duties.

o doubt much was learned by all concerned in the mobilization and muster in
ne National Guard, and the experience gained will be of value in future mobili-
ons. It was apparent that few medical officers of the Guard, when mustered
the Federal service, had an adequate conception of their duties, responsibilities,
requirements.

The department surgeon, Western Department, reports the general
lth of the troops in that department during the year as having
n satisfactory in every respect, no diseases due to insanitary
ditions having been reported from any post.

He reports 3,363 admissions to sick report during the year, and
admission rate of 482.3 per thousand as compared with 559.56
1915; the mean strength of the department during the period
s 6,972.

A total of 6,750 venereal prophylactic treatments were adminis-
ed during the year. The admission rate per thousand for venereal
eases, as reported by the department surgeon, was 72.29, as
npared with 72.59 during the preceding year.

Regarding sanitary conditions and the water supply, the depa ment surgeon states:

The sanitary conditions throughout the department for the year were very go No inspections were made by the sanitary inspector of the department during year, owing to the lack of mileage.

As stated in last year's report, the water supply of the Presidio of San Franci Fort Winfield Scott, the Letterman General Hospital, Fort Mason, and trans dock is obtained from a small stream (Lobus Creek), very liable to contaminati This water has for some time been subjected to mechanical filtration. Last y it was recommended that a concrete dam and two sedimentation tanks be built replace the present plant, which is old and inadequate. This recommendation approved and bids for the new plant will be opened in the near future. A chlor apparatus was installed September 23, 1916, and has been giving satisfactory servi

To prevent contamination of the watershed in question, relief sewers for flood wa and sewer connection by all residents of the property there is required. S remedial measures have been taken during the year, and joint periodical inspecti of the premises are now made under the continual and joint supervision of the bo of health of the city, the surgeon, and the quartermaster of the Presidio.

A strip of land has also been purchased by the Government between Fiftee and Twenty-fourth Avenues so that the military authorities may take adequ means to protect the watershed of this upland. Furthermore, the city of San Fr cisco has applied to Congress for the right to maintain a concrete sewer across a tion of the Presidio grounds for storm water, which hitherto has washed much f into the creek.

The erection of a dam at Twenty-fourth Avenue is also contemplated, which still further reduce pollution of these waters by reducing the watershed liable contamination.

One sanitary measure of importance still remains to be taken, however—that to secure the balance of the holdings on the south bank of Lobus Creek to the to the watershed. The extent is to tender this land to the Federal Government in change for the land under the Fine Arts Building of the exposition.

The military importance of securing a good water supply here should be clea appreciated. This is the only running water supply on the peninsula that can be shut off in time of war. It is adequate to supply all the agencies of the Fed Government, and the only measures in addition to those now being taken and s to be taken is the acquirement of this land on the south bank of Lobus Creek.

With reference to hospital accommodations at Fort Rosecrans is stated.

The hospital at Fort Rosecrans is in size entirely inadequate. It is used as a b hospital for the troops at Camp Walter R. Taliaferro, San Diego; Camp Lawrenc Hearn, at Palm City; the Signal Corps Aviation School and one company of Infan at Tecate. The hospital is continually overcrowded and many of the patients being cared for in tents. Estimates for the erection of a 24-bed ward are now b prepared.

The department surgeon, Central Department, reports as follo

The medical officers in this department December 31, 1916, consisted of 1 colo 2 captains, Medical Reserve Corps, 12 first lieutenants, 2 dental surgeons, an contract surgeon.

One lieutenant, Medical Reserve Corps, was ordered on active duty for a limi period in connection with special eye and ear examinations of candidates for Officers' Reserve Corps, aviation section. There were also present in the departm on temporary assignment in connection with muster out of National Guard, 5 capta Medical Corps, and 1 first lieutenant, Medical Reserve Corps.

There has been felt an acute shortage of medical officers within the departm for the larger part of the year, the greater number of posts having been without services of a medical officer. Medical service has been rendered at a number of vacated posts by the visit, which generally has been satisfactory. A single compl emanated from one of the doctors who feels that he has been grossly underpaid services rendered at a post about 3 miles distant.

The Medical Department enlisted personnel on December 31, 1916, comprised 4 sergeants, first class; 8 sergeants, 1 lance corporal, 5 acting cooks; 22 privates, f class; and 38 privates.

Referring to the caliber of recruits received at one of the stations, the post surg reports as follows:

It is also noted that of 15 recruits, Medical Department, received at this station ing the last seven months, only 5 of them have shown sufficient intelligence to rn any of the more intricate duties of a post hospital. Two additional ones have wn great willingness, but are handicapped by a lack of education, and only one bably will succeed in completing satisfactorily a subject in course of instruction v carried on; the other 8 have been more or less worthless and lack intelligence l interest, and when offered opportunity to improve themselves they showed no bition and failed to make the least effort to take advantage thereof. In general, recruits received for this detachment seemed far inferior in appearance, etc., to average received for the line organizations here. It is recommended that recruits transfer to the Medical Department from companies at recruit depots be selected medical officers who understand the duties of the enlisted men in their department order to transfer the right men for the work."

Much of the time (as at present) at nine stations there were two men or less, a num- entirely inadequate to properly care for the buildings and property pertaining the Medical Department. With this limited number, however, such buildings l property have been protected in general.

A large proportion of the privates and privates first class are inexperienced, owing the fact that the greater number of instructed soldiers were sent to the Southern partment during the year in connection with the mobilization of the National ard on the Mexican border, they being superseded in a large measure by recruits. e discipline of the corps, considering the large influx of recruits and confusing nditions, was reasonably good.

The changes during the year were:

Gain.

enlistment	8
reenlistment	2
transfer from other stations	119
transfer from the line	6
om desertion	4
Total	139

Loss.

scharge by expiration term of service	6
scharge for disability	0
scharge on account of traits of character not suited for the military service par. 148½, A. R.)	1
scharge by purchase	4
scharge by sentence of general court martial	9
scharge without honor	3
nsferred	133
tired	1
ed	2
serted	13
Total	172

The loss from all causes exceeded the gain by 33. As formerly expressed, it is vious that the inducements for service in the Medical Department for enlisted sonnel are inferior to those offered in other branches of the service, causing desirable l trained men to leave by transfer and also to reenlist for service in the line. It oped, however, that the two new grades established by the act of June 3, 1916, l act as a stimulus and prevent this exodus from the enlisted ranks of the Medical partment.

Owing to the large number of recruits as well as to the constant movement of dical Department personnel for muster-in and muster-out duty, it has been practicable to hold more than one examination within the department for pro- tion to the grade of sergeant.

The depletion of strength of command by transfer from this department to the thern Department, to which reference has been made in two previous annual orts, has continued.

The average strength of command for 1916 was 1,540.98, a decrease of 1,192.64 from 5, about 44 per cent. For a number of months there has been no unit (company) h the department.

HEALTH OF COMMAND.

The health of command has been generally satisfactory, the admission rate thousand being 746.28 against 844.91 for last year. An increase in tonsilitis over l year is noted, although a marked decrease is shown in the admission rate for influen

An extensive epidemic of whooping cough prevailed among the children at F Leavenworth during March and April; no cases occurred among the troops. T cases of scarlet fever are also reported from Fort Leavenworth among the childr of the post. There were also present at the post four cases of mumps, two in recru who had contracted the infection before arrival at the post and two among t Quartermaster Corps detachment. Four cases of measles occurred at Fort Leav worth in recruits who had contracted the disease before arrival, and four cases a occurred among children, confined to two families, the source of infection be reported at the town of Leavenworth. Necessary measures were taken to isolate infectious diseases in hospital in case of troops and quarantine steps taken in case families. No spread occurred except in the case of whooping cough epidem although this did not assume serious proportions.

Fort Riley reports a number of cases of smallpox and infantile paralysis in t vicinity of the reservation, but prompt measures of quarantine in each case sa guarded the garrison against infection.

The total admissions to sick report from disease and injury were 1,150, an admiss rate of 746.28 per thousand. Thirteen thousand nine hundred and sixty-one da were lost by sickness, making a constantly noneffective rate per thousand from causes of 24.82.

The chief causes of admission to sick report were:

Tonsillitis	
Gonorrhœa and sequelae	
Influenza	
Bronchitis	
Rheumatism	
Syphilis	
Alcoholism	
Eye, diseases of	
Ear, diseases of	
Measles	
Tuberculosis	
Venereal ulcer and sequelæ	
Appendicitis	
Dysentery	
Malaria	
Mumps	
Pneumonia	
Diarrhea	
Diphtheria	

There has been no case of typhoid fever in the department during the year amo the Regular Establishment. Two cases occurred at Fort Snelling, Minn., among t First Minnesota Field Artillery.

Number of cases in which typhoid prophylaxis was administered during the period, Jan. 1 to Dec. 31, 1916

The admission rate for venereal disease for the year was 79.17, an increase over t rate reported for last year, which was 63.29. The increased rate, in the opinion this office, may logically be ascribed to the absence of line and medical officers of t regular service from most posts, as well as the large proportion of cases sent fr recruiting stations for treatment.

SANITATION.

The posts in this department, all with garrisons depleted, have been caring themselves with more or less difficulty owing to the shortage of personnel. Gene sanitary conditions are reported as being excellent. There is nothing of special no to report under this head.

Fort Leavenworth announces that the water supply in general has been satisfa tory, although overdosed with hypochlorites at times.

)wing to the removal of the department laboratory to the Southern Department, bacteriological and other examinations have been made at the Army Medical hool, Washington. In consequence, fewer routine examinations of water have en made.

The smoke nuisance previously reported by Fort Leavenworth continues unabated. is post reports that the central heating plant was completed more than a year ago, t that no furnaces have been installed in that building; as a result the hospital constantly filled with smoke and soot from the soft coal burned in the furnaces in hospital building.

The surgeon at Fort Riley, in referring to construction and repairs of hospitals d quarters for sergeants, first class, states:

'Nothing was allowed for the year for the latter, and only storm sashes for the lation hospital (which is unoccupied), also a few lockers for the cleaning material porches of main hospital were added. All other repairs were not allowed, and buildings affected have therefore deteriorated much more rapidly than they would d necessary repairs been allowed."

There were 13 deaths during the year, with a ratio of 8.44 per thousand, a decided rease over that of last year, 2.6 per thousand.

Eighteen men were discharged on certificate of disability, nine not in line of duty.

Twenty men were transferred to the general hospitals for observation and treatment d two sent to the Government Hospital for the Insane, Washington, D. C.

MILITIA.

Largely due to the assignment of regular officers to each camp of mobilization, neral health of militia organizations in camp was entirely satisfactory, as reflected sanitary reports submitted through this office. Consequent on the establishment mobilization camps in the 14 States within the geographical limits of this department, 58 Medical Reserve Corps officers were called into active service for examination in connection with muster in of the militia. Sixteen officers of the Medical rps were assigned to the mobilization camps as general supervisors. Thirty-six listed men of the Medical Department were also assigned to these camps from sts within this department.

Conditions at camps, as regards sanitary arrangements for general safeguarding of health of the militia, were on the whole quite satisfactory, no serious epidemics ing reported. A general lack of sanitary material was noted in the case of Ohio ops.

Smallpox and typhoid protection was, in general, promptly accomplished with the cessary vaccines shipped from Washington and elsewhere. The field and regimental hospitals, issued without requisition to serve as camp hospitals, usually ived after improvisation of camp hospitals from militia equipment. Owing to the iority of arrival of militia medical officers at most of the mobilization camps, the le and duties of "camp surgeon" remained with them even after the arrival of gular medical officers, although it was the desire of the department surgeon that ch Regular officers should supersede, both nominally and actually, militia medical icers, as directed in paragraph 593, Militia Medical Department, 1916. However, conduct of muster in physical examinations alone, under the urgent conditions taining, required such constant supervision by the Regular medical officers that first incumbent was usually allowed to continue in the office of camp surgeon. ving to the press of work in this office consequent on mobilization, and due to the t that the sanitary inspector was assigned to duty at Fort Benjamin Harrison as mp surgeon, it was not practicable for the department surgeon or the sanitary pector to make inspection of mobilization camps.

The large percentage of rejections at the muster in physical examinations in some the State camps appears to the department surgeon as the most disappointing and creditable feature of the mobilization, indicating that the enlistment examinations d been nominal and superficial.

The department surgeon, Southern Department, states:

The following report of the operations of the Medical Department in the Southern partment is submitted as a general survey only of work done and results attained er a wide extent of territory and with troops of all degrees of experience and training. e more important special reports on which this communication is based, which sent herewith, will give in more detail what is here reported in brief. Certain portant data concerning health of troops during the early months of 1917 are cluded in this report, but figures given are only approximately correct, as at the ne of writing, all returns are not in the office. On April 1, the demobilization of the Militia was practically over in so far as the Southern Department is concern and it is thought best to include such data as may prove valuable in view of t prospective organization of a great army for the defense of the country.

PERSONNEL.

Officers of the regular Medical Department, including lieutenants of the Medi Reserve Corps, reached a maximum of 356 in the Southern Department.

Of mobile sanitary units, there were six permanently organized field hospit and six ambulance companies, to which three each have been added with provisio organizations. All of the permanent units are now supplied with motor transpor tion; the provisional organizations as yet having animal-drawn vehicles.

Deducting all Regular officers whose duties were altogether with militia, all t extra personnel at base and camp hospitals made necessary by militia patients, a a few stationed at remote outpost camps, there have never been enough to furn the authorized quota for the Regular force in the department, and of the mobile un only half the authorized number were at first available, increased later to thr fourths requisite number by organization in the Southern Department of three p visional field and ambulance companies.

The expedition into Mexico was much better supplied with medical person than the Regular troops remaining north of the border, but even in this colum was not always easy to maintain an allowance of two medical officers to a regime and the regiments on the American side were often reduced to one medical offic a lieutenant of the Medical Reserve Corps. To the last-named troops, of cour well equipped camp and base hospitals were easily accessible.

Medical officers of Militia attained a maximum number of 559 and about one-h only of the necessary field sanitary units were mustered into the United States servi

The number of militia medical officers fluctuated greatly by loss from resignati not always compensated for by new appointments.

It is a conservative statement that had all the United States forces in the depa ment been called upon to advance into Mexico, the shortage of medical offic Regulars and Militia, would have been about 600. This estimate takes into conside tion the necessary medical personnel at headquarters of field armies and divisio evacuation hospitals, trains, and a proper service of the base, as well as a full qu for regiments, separate companies and battalions, and, of course, the authori number of field hospital and ambulance companies for 13 divisions and nine indepe ent brigades.

As it fortunately happened, the medical force, Regulars and Militia, was suffici to cope with the situation, both in the admirably managed expedition into Mex and throughout the large camps in the Southern Department.

Of Regular dental surgeons, there was a maximum of 43. Dental officers of mili were almost nonexistent at first, but finally 56 were mustered into service and report for duty before all of them could be supplied with equipment, as dental engi seemed to be almost unobtainable in the United States.

During the beginning of the mobilization, the Regular dentists were almost ov whelmed with work, but toward the close of the year the work was well in ha for all troops.

The faithful and efficient work of the medical and dental officers is worthy of praise. Few, indeed, have failed to meet the many and new responsibilities wh were imposed upon them.

During the height of the mobilization many of the brightest young physici and surgeons of the country gave their services as officers of the Medical Reserve Cor When it became apparent that active war was not impending, many of these m were relieved from active service in order to resume their important duties in ci life. Some have successfully passed the examinations for the Medical Corps and ma excellent ones remain, barred by age from the Regular corps. A large proportion the Medical Reserve Corps who have proved themselves on the border have b recommended for higher grades in the Officers' Reserve Corps. Some physici were enrolled in the Medical Reserve Corps and sent to the department who w entirely unfitted by old age, physical disability, temperament, or education for position of a medical officer, but the proportion to the whole number of Medi Reserve Corps officers was very small.

The medical officers of militia were almost invariably high-grade men of excell professional attainments. From them were drawn for service at some of the larg camp hospitals, surgical operators, pathologists, and specialists of the most effici type.

There is also no lack of theoretical knowledge of military hygiene and camp sa- tation on the part of the large majority of militia medical officers, some of whom h ined much experience at camps of the National Guard. The weak points are in litary medical administration, and especially in the rendering and keeping of ports and records of sick and wounded and the handling of other essential papers.

It is hard for an officer who has not grown up in the service from lieutenant to major grasp the fact that the "red tape" of the Army is the result of years of experience d is really the simplest way yet devised of "running the machine" under the law th justice to the Government and the individual, even though the system is still sceptible of much simplification.

In his professional dealings with his patients, who are generally from his own sec- n of home territory, and to a less degree in his sanitation work, the medical officer militia is much handicapped in doing his duty "without fear or favor." In pro- uncing upon cases "not in line of duty" or in recommending sick leaves, sick fur- ighs, transfers to hospitals, etc., he must constantly confront the dilemma of either ciding against his real opinion or risking his popularity and professional success in il life.

This is a hard position in which to be placed, but it is inseparable from the system using for United States service troops with concentrated local influence, political social.

Another handicap is the absence of trained noncommissioned officers for the prepa- tion of reports and records. Enlisted men with clerical experience in civil life are adily obtainable from the ranks of the militia, but they must be trained for their ilitary duties by medical officers to whom the paper work of the Medical Depart- ent is utterly unfamiliar.

The experience gained by the medical officers and enlisted men of the militia dur- g the mobilization of 1916 has been invaluable in spite of handicaps, and their rvices, if again needed, will prove a very valuable asset to a large National Army.

The maximum of enlisted noncommissioned officers and men of the Medical Depart ent was 3,045, and of militia 4,144. A casual camp for recruits of the Medical epartment was maintained at Fort Sam Houston and one at Fort Bliss, to which a fficient number of men were supplied as needed and from which they were distrib- ed after a brief period of training. Considering the rawness of this personnel, very od discipline prevailed at the hospitals, and excellent progress was made in training really valuable force. The lack of old, experienced, noncommissioned officers in e Medical Department stimulated efforts to train and promote the best privates, th tolerably good results. Many of the best sergeants and sergeants first class were eded to check and supervise the medical records of militia organizations at the ices of district surgeons, and many more could have been used to advantage in the aining of the militia in proper preparation of papers and records. The creation of ncommissioned officers with limited warrant in the mobile units released many luable men for other uses.

The enlisted personnel of the Medical Department in the militia was of high quality, ntaining many medical students of good education, but inexperienced for the most rt in the duties required of them, oftentimes expecting to perform professional work ly proper for officers and occasionally resenting or neglecting the humbler but just necessary duties of attendants and laborers. Some State organizations reported ithout medical personnel of any kind, but in course of time the deficiency was in rt made up by transfer of enlisted men of the line.

The conduct of the enlisted force was admirable, as, indeed, was that of the militia ldiers generally throughout the department. Whatever the defects of the militia stem, the men were a splendid body of Americans from the standpoint of personal havior.

The maximum number of female nurses was 251, of which 67 were members of the rmy Nurse Corps and 184 were reserve nurses furnished through the Red Cross.

Nurses were on duty in five base hospitals and six of the larger camp hospitals. heir services have been uniformly excellent. The Army thoroughly appreciated e ministrations of these fine women, and the reserve nurses cheerfully adapted emselves to the discomforts of border service.

There was but one incident of insubordination and desertion among the nurses ported to this office.

Strength, Sickness, and Mortality.

STRENGTH.

The strength of the command in the Southern Department during the calend year 1916 varied from a minimum in February, 1915, of 26,068 officers and enliste men, all of the Regular Army, to a maximum in August of 158,569 officers and enliste men, regulars and militia.

At the end of the year the regular troops had reached the maximum strength 49,164, and the militia, which had attained its greatest strength of 110,526 in Augus was reduced to 82,174.

The mobilization of the militia began in May with the muster into Federal servi of troops from Texas, Arizona and New Mexico, of whom about 5,000 were secur in May and June.

On June 18, the entire National Guard of the States was called out at home station and by the end of July, 105,137 were distributed in large camps along the borde The number of militia increased during August to 110,526 and diminished graduall to the end of the year by the loss of certain organizations sent home for muster out, loss which was partially compensated for by the arrival of new troops which had bee held for training at the home camps. Altogether about 130,000 State troops serv in the Southern Department during the year 1916.

The demobilization of the Militia has been carried on as rapidly as possible sin the close of the calendar year and was very nearly completed on April 1, 1917, which time all the Militia organizations except those of the States composing t Southern Department, had left the department for muster out.

The handling of such a large number of newly-raised troops, in addition to abo 47,000 regulars called for extraordinary efforts on the part of the Medical Corps along t lines of camp inspection and sanitation; supplies, erection of temporary hospitals f the care of the sick, and instruction of officers and men of the sanitary troops wi Militia regiments, and of the mobile field units.

HEALTH OF TROOPS.

The statistical tables and reports of medical officers accompanying this report wi show how successful the efforts to guard the health of the troops, to care for the sic and to instruct the sanitary personnel have been. Beginning with July 31, wh the strength of troops was nearly at its maximum, weekly statistical reports of si were wired to the Surgeon General, a survey of which shows a sick rate for regula from 10.8 to 35 per 1,000 and for militia from 9 to 31 per 1,000. At the end of the ye the rates for the regulars and militia equal, namely, 31 per 1,000. These rates co pare favorably with the lowest attained in the Army in time of peace, and sh quite clearly that camping on the border has involved no more risk to life and heal than if the troops had stayed at home.

The Southern Department, comprising as it does a wide extent of country wi much diversity of climate, presents a number of special problems in connection wi season and terrain to be taken into consideration in the sanitary care of troops.

During the hot season, the troops in the Brownsville district were subjected intense heat and torrential rains, causing almost bottomless mud, which, with mo quitoes and an unusual plague of flies, made this section most uncomfortable for cam life. With the advent of winter, the climate in this section becomes delightful.

The western districts—El Paso, New Mexico, Deming, Arizona, and Nogales have a dry summer climate, healthful and invigorating in spite of heat, but duri the late autumn the nights become very cold; in winter the weather is at times ve disagreeable, lasting well into spring. The weekly sick rates by districts show to limited extent the effect of season and climate upon the health of troops, but oth conditions resulting from special duties of troops and from the limited outbreak certain infections, for example, paratyphoid fever and malaria in Brownsville d trict played a greater part than climate and season.

A serious outbreak of pneumonia and the present epidemic of influenza, measl and mumps in western districts are exceptions. Here camp life, partly on accou of climatic conditions, favored the spread of the infections and was a principal existi cause of pneumonia and other acute respiratory diseases.

A brief survey of the weekly sick reports of districts shows for the calendar ye 1916 that highest rates for both regulars and militia were reached in November a December.

Districts.	Highest rate per 1,000 weekly, 1916: Regulars.	Highest rate per 1,000 weekly, 1916: Militia.	Season: Regulars.	Season: Militia.
rownsville	31	35	November	November.
ew York division (militia)		30		Do.
n Antonio (Camp Wilson)	39	33	December	September.

ew Mexico	36	54	August	Do.
rizona	38	50	December	Do.
ogales	48	101	do	Do.
xpeditionary force in Mexico	29		November	

Unfortunately, the favorable sick rates for the calendar year 1916 have not con- nued into 1917. The wide prevalence of influenza, measles and mumps in the estern districts, the incidence of pneumonia and bronchitis in the same territory ave greatly raised the figures for both sickness and mortality.

Many of the militia regiments in that part of the department were late comers from e Southern States, and arriving at the beginning of cold weather, suffered keenly om the change of climate. Among the men, mostly from rural districts, were many onimmune to measles and mumps, and as these diseases are widely spread in the order towns, troops at Deming, El Paso, Nogales, and Douglas were seriously affected obar pneumonia appeared and has proved the principal cause of mortality. Broncho- neumonia and empyema have been serious complications in measles.

The rise in sick rates has manifested itself mainly in the militia and during January, ebruary, and March have reached the maximum figure at Nogales (among Alabama oops) of 113.2 per 1,000, and for regulars at the same place 57.7 per 1,000.

During the same months the Brownsville district, enjoying beautiful winter weather, as not exceeded the rate of 25 per 1,000 for either militia or Regulars.

At Camp Wilson, adjoining Fort Sam Houston, sick rates increased materially in nuary, February, and March, due to measles, which is very prevalent in San ntonio, and which, in this camp, affected principally the Alabama and Mississippi oops.

High rates for Camp Wilson have been in January, February, and March, 39.8 for gulars and 59.7 for militia.

The great difference between organizations in this camp is shown by the enormous te for measles in two regiments—First Alabama Cavalry and First Mississippi In- ntry, which, with 2,411 strength, had 274 cases of measles, or 12.9 per cent; all the her troops in camp (strength, 6,951) showing only 0.66 per cent of measles.

MORTALITY.

In the year 1916, there were 232 deaths among Regular troops, of which 149 were om injuries of all kinds, including deaths in action in the Mexican expedition.

The rate per 1,000 was 3.65 from injury and 2.03 from disease, a total rate of 5.68.

For the eight months of 1916 in which militia were in the Southern Department, ere occurred among them 156 deaths, of which 43 were from injury and 113 from sease.

Averaging the strength of the State troops as 76,645, there is shown a death rate of 03 per 1,000 for the period May–December, 1916, or for disease 1.47 and for injury ly 0.56.

Except for the heavy incidence of pneumonia, which began in December, the ortality rates of both Regulars and militia would have been considerably lower, ut as has been already mentioned, this disease beginning in epidemic form in Decem- er, has taken a heavy toll during the first three months of 1917.

HEALTH STATISTICS.

Admissions during calendar year 1916 for the following diseases:

Mean strength	40,732

SPECIAL DISEASES.

Typhoid fever.—Forty-four cases were reported for the period; 11 for Regulars with atio of 0.27 per 1,000, 33 for militia with a ratio of 0.43 per 1,000. Some of these lividuals were unprotected, some were inoculated with State vaccines not beyond spicion of imperfect preparation or administration, while a few had been thoroughly ccinated at a recent date.

Seven cases developed in the punitive expedition; one was unprotected and the hers had received the prophylaxis from two and one-half to five years before. There re seven cases at Terlinqua, Tex., in the Big Ben district. The first two (civilian ployees) were unprotected, and the one death which resulted was in the remaining e protected cases—a first lieutenant, Medical Reserve Corps, on December 12, 1916. o had also a history of a previous attack of typhoid fever.

Typhus fever.—No typhus fever occurred among troops, which is gratifying, as it is own to be present in El Paso and very prevalent in northern Mexico. Many of the ops must have been more or less directly exposed to it. So far as reported, only e case, in a civilian employee (Mexican), was treated by the Army.

Paratyphoid fever.—This disease is common throughout the more densely populated tions of the department. There were 450 cases up to December 31. Ninety-three these were from the punitive expedition, but the division surgeon thinks several nes as many really developed in the guise of mild continued fevers which could not accurately diagnosed in the field. The disease ceased after the command received paratyphoid prophylaxis.

Upward of 175 cases were from the New York division stationed at McAllen, Tex., l vicinity. Of these, more than 60 were from the Fourteenth New York Infantry, to 30 from the Second, Twelfth, and Sixty-ninth Infantry of the same State, and rest from 14 other organizations.

The command, with possibly a few exceptions, due to return of organizations to eir home State for muster out, was inoculated with mixed vaccines of paratyphoid ." and "B." As some cases occurred about the same time at the nearby camps of nna, Llano Grande, and Mercedes, these commands were also immunized. The mission rate was highest in October and November. The administration of the phylaxis was nearly completed by December 1 and thereafter only an occasional e of paratyphoid appeared.

Maj. C. LeR. Cole, Medical Department, was sent with a portable laboratory outfit study the disease in the Brownsville district, and an extensive report is now being pared for publication by Lieut. Col. F. P. Reynolds, the general sanitary inspector Brownsville district, and Majs. Siler and Cole and Lieut. Schule, all of Department boratory No. 1. Outbreaks of paratyphoid have appeared in the United States no ubt many times, but the intensive study of an outbreak with such a large number cases has not yet been recorded.

Malarial fever.—There were 1,941 cases for both Regulars and militia, but many of se were recurrences, the infection having originated elsewhere than at border stans. However, the rate was less by 9 per 1,000 than the whole Army in 1915.

Measles.—Up to the 31st of December, 785 cases were reported, which gives nearly same rate as for the Army in 1915. The presence of nonimmune soldiers in overted amd improperly ventilated tents during cold weather seems to be the chief tor in the spread of the disease. Respiratory complications were most common in colder regions. At the camp hospital, Deming, N. Mex., malaria was found croscopically in 50 per cent of pneumonias, complicating measles.[1] From January 1917, to April 1, 1917, 1,295 admissions have been recorded, 720 of them being from Paso and Nogales districts alone.

Smallpox and scarlet fever.—Nothing of interest was noted with reference to smallpox l scarlet fever. There were 10 cases in all of the former and 15 of the latter.

Diphtheria.—Fifty cases of diphtheria occurred up to December 31. Whenever it peared routine throat examinations revealed a number of carriers; the disease was ld and easily controlled.

Influenza.—There were 3,305 cases of influenza, Regulars and militia included, ich is about 7 per 1,000 less than for the whole Army in 1915. From January 1 to ril 1, 1917, 2,722 more admissions occurred; 1,943 of these were from the El Paso l Nogales districts. These last figures only indicate cases so far recorded from sick l wounded reports in this office, and many reports are still to be received. The ures given are therefore far too low. This disease and other respiratory infections were most prevalent in the colder districts, but the admission rate was general lowered when assemblages in amusement rooms, theaters, etc., were prohibited a proper ventilation of tent quarters was enforced. It is almost impossible to cont the tendency of soldiers to live in tightly closed overheated tents during cold weath One reason for this is that some articles of uniform clothing and bedding as issued winter use are of insufficient weight and too loosely woven to retain body warmth.

---

[1] As Deming is in absolutely nonmalarious territory these were cases of "latent" malaria in the kansas National Guard.

18521—17——9

Pneumonia.—In November and December, 1916, the sick and mortality rates both Regulars and militia began a disquieting rise on account of lobar pneumonia a broncho-pneumonia, the latter-named disease generally a complication of measles influenza.

For the Regulars in 1916 there were 78 admissions and 17 deaths; for militia, 114 missions with 38 deaths. (The admission rates are below the actual because trans cards and changes in diagnosis have not been tabulated in this office for statisti purposes, so that many cases marked on original admission as "undetermined" "influenza" were treated later in hospital as pneumonia.)

In the early months of 1917, January, February, and March, pneumonia of bo kinds reached the proportions of a veritable epidemic in the mountainous weste districts of El Paso, Deming, New Mexico, and Arizona. Pneumonia was coincide with an extensive epidemic of measles, mumps, and influenza among the civil popu tion as well as among the troops.

Lobar pneumonia was occasionally and broncho-pneumonia generally a complic tion of measles or influenza.

In the eastern districts of the department where measles was also epidemic, a mo erate incidence of pneumonia only occurred.

In the above-mentioned western districts, much of the militia came from far Sou ern States, arriving late in October, unaccustomed to the great diurnal changes of a d mountain climate.

The return of the expeditionary force from Mexico brought back a body of men w had been most carefully looked after but whose reserve strength had been lowered the long and anxiety-breeding service in Mexico. The men were starving for amu ment and naturally were exposed to infection at moving-picture shows and other pu lic places.

The figures for sickness and mortality in the El Paso, New Mexico, and Arizona d tricts and at Deming, from the beginning of the epidemic in November to April, 19 when it ceased, are as follows, from base and camp hospitals:

	El Paso.		Deming.		Douglas.		Nogales.	
	Regulars.	Militia.	Regulars.	Militia.	Regulars.	Militia.	Regulars.	Militi
Lobar pneumonia:								
Admissions	182	203	2	52	23	5	10	
Deaths	33	39	....	3	2	....	1	
Broncho-pneumonia:								
Admissions	5	8	....	20	15	6	....	
Deaths	3	6	....	12	2	2	....	

A total in these districts of 679 cases of all pneumonias with 132 deaths, of which cases and 29 deaths, are broncho-pneumonia usually as a complication of measl Everything possible was done to check the spread of pneumonia, even to quarantin some of the camps and forbidding the soldiers to visit the towns. The tentage all ance was increased and intensive inspection of tent ventilation at night was institut

At El Paso, Department Laboratory No. 2 undertook the differentiative of type pneumococcus in 150 cases, and serum treatment was given in nearly as many.

Type.	Prevalence of type.	Mortali

IV	[illegible]	

An interesting and timely report on this work by Maj. Henry Nichols has been forwarded for publication.

ysentery.—Entamoebic dysentery is endemic in the El Paso district and in the occupied by the punitive expedition. This force was composed of Regulars, h probably accounts for the greater number among them, although some were no ot relapses, the initial infection having been contracted in our tropical possessions. Regulars had 150 and the militia 13 admissions. Eighty-seven cases of bacillary ntery were also reported. A report on entamoebic dysentery in the El Paso dis- has been published by Maj. Craig, Department Laboratory No. 2.

mp diarrhea.—Camp diarrhea prevailed among nearly all of the militia troops tly after arrival at border stations, but subsided quickly as the men became ad- ed to the changed environment. The most common cause was fermentative dis- ance resulting from improper preparation and use of the ration, but in some in- ces the exciting irritant was probably alkaline drinking water, highly impregnated certain mineral salts to which many men were unaccustomed.

ulmonary tuberculosis.—The Regulars, with 139 cases (3.41 per 1,000), did not ed the rate for the whole Army for 1915. The militia had a much lower rate (1.25 1,000) or 96 cases.

ookworm.—The First Alabama Cavalry and the First Mississippi Infantry, at Camp on, showed during January, February, and March, such large sick rates compared troops from Northern States and with the Regular regiments in camp, that sus- on of some underlying cause of a general nature weakening the average resistance ese men to disease was aroused. No admission for the clinical symptoms of unci- asis had occurred, but at the instance of the division surgeon, Twelfth Provisional sion, a survey of these troops was made to determine the presence of hookworm, accomplished by Department Laboratory No. 1, with the assistance of regimental ers.

xaminations of samples of feces of 2,692 men were made with following results:

	First Alabama Cavalry.	First Mississippi Infantry.	Fourth Texas Infantry.
gth	1,180	1,172	1,100
ber examined	911	895	898
ent positive ......per cent	54	32	6
num (in company) ......do	13	12	
mum (in company) ......do	78	53	21

ompanies from rural districts showed highest rates. The findings were negligible roops from dry regions of Texas.

he unusually large mortality of the Alabama and Mississippi troops was due to sles and respiratory troubles. Measles patients in whom hookworm was found, ned more liable to complications, lobar and broncho pneumonia, bronchitis, and s media, than others in the approximate ratio of 2 to 1. Measles occurred much e frequently in men affected with hookworm; ratio about 2½ to 1.

he influence of hookworm infection on incidence of measles may possibly be an rect one. Such men are subnormal men, easily tired out and much more apt to up in overheated and tightly closed tents where infection from incipient cases of sles was acquired.

must be stated also that the Alabama Cavalry were of much younger age on an rage and that they drilled more incessantly, in a more arduous form of exercise. eport of Maj. Siler in detail of this survey has been forwarded for publication.

he patients found to harbor hookworm were properly treated for the disease before ving camp for their home stations. That all troops from hookworm-infested sec- s of the United States should be surveyed at mobilization camps and cured is the phatic lesson of this survey.

enereal.—Taking syphilis, chancroids, and gonorrhea together, the Regulars had 7 admissions or 140 per 1,000, and the militia 3,394 or 44 per 1,000. The great erence in these figures in favor of the State troops is due to a greater moral restraint he militia, limited access to prostitutes by reason of large size of their camps and part to failure of medical officers to detect and record many cases as required by ers. The opposite conditions usually existed among the Regulars.

lcoholism.—The Regulars had 289 cases, ratio 6.87 per 1,000, which is less by half n for the Army in 1915. The militia recorded only 108 cases, with a ratio of 1.40 1,000. This difference is largely caused by circumstances similar to those men- ned under venereal diseases.

CAMP SANITATION.

Inspection.—During the militia mobilization, seven general sanitary inspect were authorized by the War Department for the Southern Department and instruct to report the results of their inspections and recommendations to The Adjutant Gene through department headquarters. Each of these officers covered one or more distric and they were most helpful in securing action to put the large camps for militia tro in a satisfactory state of comfort as rapidly as conditions allowed. Several of th officers also acted as district inspectors, rendering weekly reports to department he quarters.

In other cases, the district surgeon was also sanitary inspector of the district, when the number of troops and separate camps required it, a district sanitary inspec was appointed with no other duty.

Every large militia camp had also one or more camp sanitary inspectors of the regu Medical Corps, whose entire time was given to the work of inspecting and instruct the untrained troops in the care of their camps and personal hygiene.

The excellent service of the camp sanitary inspectors can not be adequately judg from their brief official reports. As friendly advisers of the militia medical offic their services were invaluable and for the most part thoroughly appreciated.

By circular, Department Surgeon's Office, issued July 11, 1916, camp sanit inspectors were directed to render weekly reports under certain specified headi through the general sanitary inspector of the district, as follows:

HEADQUARTERS SOUTHERN DEPARTMENT,
OFFICE OF DEPARTMENT SURGEON,
Fort Sam Houston, Tex., July 11, 191

Circular to each camp sanitary inspector in the Southern Department.

1. You will report immediately on receipt of this circular, and thereafter wee on Saturdays, the sanitary condition of your camp, sending report to this office thro the general sanitary inspector of your district.

2. This report will cover the following subjects and should be as concise as p ticable.

I.

General condition of
- (*a*) Camp site.
- (*b*) Water supply.
- (*c*) Latrines and their care.
- (*d*) Food and its preparation.
- (*e*) Disposal of kitchen and corral waste.

II.

(*a*) Rate per 1,000 on sick report on day preceding report.
(*b*) Prevailing diseases, if any.

III.

(*a*) Rate per 1,000 on sick report from venereal disease on day preceding report
(*b*) Is venereal prophylaxis being carried out?

IV.

(*a*) Any special insanitary condition.
(*b*) Steps taken to remedy same.

V.

(*a*) Progress of vaccination against typhoid and smallpox.
(*b*) A special report will be made to this office when both procedures are comple

VI.

(*a*) Completeness and adequacy of sanitary supplies.
(*b*) Are requisitions being submitted to remedy deficiencies?

VII.

Remarks.

Vhen defects or delinquencies in camp sanitary conditions were reported, remedial on was, whenever possible, taken at once, and when construction was delayed or erial obtained only with difficulty, all humanly possible efforts were made to expedite completion of the camps and to supply the troops. The recommendations of the lical department have almost universally been approved and carried out by comnding officers and quartermasters. It is a pleasure to acknowledge the hearty rit of cooperation which prevailed between the line and staff corps in the Southern partment whenever the welfare of the troops was involved.

'he medical officers of the militia were, as a rule, men of high grade, professionally, l were well acquainted with the principles of military hygiene. Camp sanitation, vever, requires more than expert knowledge on the part of a few trained men. All officers and enlisted men must be taught the necessity for almost meticulous care carrying out many rules which appear to them more or less unimportant, or else the lel camp becomes an impossibility.

'he human factor is all-important; the officer must direct and enforce obedience; soldier's obedience must become habit and when this state of discipline is attained, np sanitation is easy for all.

fuch variation in this personal element was observed in the case of the camps of itia organizations, but even the most inexperienced troops showed great improvent in maintaining sanitary camps. Some of the militia regiments went home for ster out with a record of no deaths from disease and no case of preventable infectious ease. To bring back, with this record, a regiment of robust, healthy men in better rsical condition than when it left home should indeed be a source of just pride to line and medical officers.

'he experience gained in the mobilization of the militia has in every way confirmed belief of medical officers in the almost mathematical correspondence of efficiently ried out sanitation with general efficiency of troops for the use of the Nation. The c report is an excellent index of the value of the organization. Eliminating casualdue to service unavoidable exposure to climate, and fatigue and to certain comn infections of civil life, against which we are as yet almost helpless, the best iments and even the best companies in a regiment will in the long run, show the vest sick rate. Good luck in escaping sickness is far less a factor than intelligence l fidelity in the care of person and environment, and when these qualities are sent and exercised along sanitary lines, it is axiomatic that they will also act in er directions.

'onfidence has also been strengthened in our recognized sanitary procedures, which re, on the whole, stood the test of service on a large scale. It is highly desirable t all structures, appliances, and furniture used for sanitary service in permanent nps or in the fields with the mobile army should be standardized and made a matter regulation; but here again, it is not so much a matter of the instrument, as the way which it is used.

sanitary order (General Orders, No. 13, Headquarters Southern Department, y 10, 1916) was issued very soon after the militia troops began to arrive in number s order covers in simple language all the necessary sanitary procedure, and fixes the ies and responsibility of line and staff officers in carrying out its requirements.

NERAL ORDERS,}
No. 13. }

HEADQUARTERS SOUTHERN DEPARTMENT,
Fort Sam Houston, Tex., July 10, 1916.

'he following sanitary regulations will be strictly complied with at all camps within limits of the Southern Department:

. The maintenance of sound health is necessary to the welfare of the individual l of military efficiency. All members of this command are enjoined to carry out requirements of this order in letter and spirit. Any infractions thereof will unmly be made a subject of disciplinary action.

ll work needful to proper sanitary conditions of this command will be carried out hout delay.

?esponsibility for sanitation.- Battalion commanders are responsible for the police l sanitation within their battalions. They will see that their respective battalion as are ready for sanitary inspection by 9 a. m. daily, and will personally inspect parts of such areas twice daily in company with a medical officer of the regiment. ey will take such measures as are necessary to insure effective sanitation within npanies.

'he adjutant quartermaster, and company commanders are similarly responsible the enforcement of this order within the headquarters company, supply company, l machine gun company.

Sanitary function of the surgeon.—The surgeon of a regiment is its sanitary offic He will inspect the entire regimental area at least once daily, subsequent to 9 a. m

He will give special attention to the maintenance of thorough camp police, t prompt and effective disposal of refuse, the destruction of flies, and the proper sanit condition of the latrines and bathhouses. He will report at once in writing to t proper battalion commander any defects noted, with proper recommendation as their remedy. If on his next inspection any sanitary defect previously reported up by him is found still to exist, he will at once report the facts in writing to the ca commander.

Camp police.—Proper neatness and police of camp sites at all times is required.

The throwing on the ground of trash, remnants of food, or other refuse is prohibit Dirty water will be disposed of only in the places and manner provided for the same

Destruction of flies.—Flies are great nuisances in camp and spread disease. Ev effort will be made to keep down their numbers and prevent their development.

Any area on which flies are seen to cluster will be burned over at once, there destroying their food and eggs. Fly paper will be hung from the ridges of the kitch tents, and requisition for the same should be made on the camp quartermaster. Ea company will at once make requisition on the camp quartermaster for three flytr and maintain same in operation.

Articles which attract flies will not be allowed to remain exposed.

Drainage.—Tentage and company streets will be ditched so as to effectively ca off all storm water. The vicinity of bathhouses will be so ditched and drained as permit of no accumulation of bath water.

Sunning of bedding and tent areas.—Bedding and equipment will be exposed to sun and wind for at least two hours each fine day. All tentage will be struck or fur for this purpose at least twice a week.

Water supply.—The water supply for every camp should be wholesome for drink purposes without purification.

Troops leaving camp for maneuvers or marches will fill canteens before leaving.

To avoid insanitary puddles about the standpipe, no water will be wasted from kitchen faucets.

All proper economy in the use of water in bathing is enjoined, as the disposal of wa water from bathhouses is very difficult in this soil. Officers will see that as soon as men have finished bathing, the flow of the water from the showers is cut off.

Personal cleanliness.—Every member of this command will bathe at least tw weekly.

Army Regulations require that each man will wash his hands before each m and immediately after visiting the latrine.

All clothing will be maintained in a cleanly condition. It may be washed in bath houses or sent out for laundering.

Foods and messing.—All fresh meat, bread, and vegetables will be inspected b medical officer, as to quality, when issued.

Food will be prepared and served in a cleanly manner. It will habitually be p tected against sun, dust, and flies. Company cooks and mess equipment and kitch areas will be neat and clean at all times.

Individual mess kits will be cleaned at the cook tent immediately after use. Co will maintain a supply of hot water for this purpose.

The keeping in the tents of uneaten portions of rations is strictly prohibited.

All members of this command are warned against patronizing places off the reser tion in which food, ice cream, or drinks are sold which are not free from flies and maintained in a cleanly condition.

No hucksters will be permitted in camp other than for delivery of supplies in g eral messes.

The bringing of melons into camp, from the great difficulty of disposing of me rinds, is prohibited.

Disposal of refuse.—Each company will construct and maintain a company inci rator of the type approved by the camp sanitary inspector. All garbage and ca refuse, other than manure and trash from the picket lines, will be promptly destro therein. No accumulation of refuse will be permitted.

Greasy water from the kitchens will be evaporated in the incinerators. To t end, all proper economy in the use of water in kitchens will be enforced.

Footwear.—Great care will be taken in fitting the men with shoes. The tip of toes should not be less than one-half an inch from the tip of the shoes when the body weight is thrown on the foot being fitted.

A sufficient supply of socks, free from holes, will be maintained by each man.

Soil pollution.—Pollution of the camp area by urination or defecation is stric prohibited.

Any person offending in this respect will be brought to trial without delay.

Picket lines will be kept policed, and manure and trash piled for removal and
posal.

Latrines.—Latrine pits will be kept fly-proof. Lids will be kept closed when seats
not in use. Seats will be scrubbed off once daily. Urine troughs will be flushed
t and swabbed with crude oil once daily. Covers will be lifted off pits and the
ter burned out with hay and crude oil once daily.

Each latrine will be inspected by an enlisted man of the Medical Department
ery two hours between reveille and retreat.

Night urinals.—A urine tub will be placed in each company street at retreat. The
und on which it is placed will be kept marked with lime and the site designated
a lantern at night.

Urine tubs will be removed at reveille, emptied into the latrine, burned out with
y and crude oil, and sunned during the day.

Avoidance of disease infections.—In view of the liability of acquiring infectious
sease, the troops of this command are warned to remain away from uncleanly habita-
ns and persons when off the reservation.

Venereal disease.—Persons consorting with loose women are in great danger of acquir-
venereal disease.

Those who have been exposed to venereal infection are required by War Depart-
ent orders to use the approved measures for cleanliness and prevention of venereal
sease. Those who fail to do this and develop venereal disease will be court-martialed
disobedience of orders.

Facilities for giving and recording prophylactic treatment are maintained at the
gimental infirmary.

Physical examination.—The semimonthly physical inspections of the men, required
War Department orders, will be completed before the 15th of each month and
ain before the 30th day of each month.

A company officer will be present when such examination is made by the medical
icer.

Use of regimental infirmary.—Minor cases only will be treated in the regimental
firmary. All others will be transferred to the base hospital.

Any man who has a fever of 101° will be so transferred without delay.

Prophylactic inoculations.—Inoculations against typhoid fever and vaccination
ainst smallpox will be prosecuted systematically under the prescribed methods
til the command is thoroughly protected against these diseases.

Publication of this order.—This order will be read twice to each organization at
treat, and a copy will be kept posted on the bulletin board of each company.

Water supply.—Water supply of camps has, generally speaking, been ample and
cellent in quality. At the large camps, natural water beyond suspicion was fur-
shed and the use of the Darnall filter, the Lyster bag, or boiled the water used for
inking has prevented water-borne diseases in the smaller camps and on the march.

The camp of the New York division at McAllen suffered from delay in piping water
camp in sufficient quantity for shower baths and laundry work, but the artesian
ter used was of good quality for drinking and cooking.

Torrential rains and unavoidable delay in delivering construction material delayed
e proper sanitary preparation of the camp at McAllen in this and other ways.

During August and September an outbreak of acute diarrhea at Douglas, Ariz.,
as at first attributed to the water supply. The water was found to be pure from
e laboratory standpoint, but impregnated with mineral salts of a purgative nature.
he outbreak, which soon subsided, is to be attributed, in my opinion, to camp
okery, indiscretions in diet, and the laxative nature of the water.

The food of the troops has been uniformly plentiful and good in quality. Its
eparation and service has been from fair to excellent, according to the capacity
d efficiency of cooks and mess management. It is most difficult to build up an
ficient kitchen department in a company of newly raised troops. Capable camp
oks, who can use the ration to advantage and furnish appetizing food under all
nditions in camp and on the march, are treasures not easily found. and it takes
me and experience to form a green man into a military cook. On the whole, the
eparation of the food was much better than might have been expected, and in
any organizations was excellent.

A crying need developed for a standard type of easily portable ice box intended
r use in camps. Makeshifts and locally constructed boxes were found very unsat-
factory and by no means economical. Recommendations for a standard camp
e box have been forwarded to the War Department, approved throughout at depart-
ent headquarters.

Care of kitchen and mess.—The care of the company kitchen and mess calls for
ore continuous inspection and action on the part of officers and men than any other

sanitary routine in camp. The kitchens and mess shelters have been screened agains insects. The great pest of flies, which is universal throughout Texas, has been com bated with traps and poison. The kitchen wastes and the scraps from the mes table have been disposed of satisfactorily in company incinerators whenever the me were held strictly accountable for misuse of the structure. A few men, by carelessl throwing the contents of mess tins on the sides of the incinerator instead of in th fire, may create a nuisance and seriously hamper the fight against flies, notwith standing conscientious efforts on the part of others.

There have been some variations in the structure of incinerators, but no new principles of importance have been evolved.

Stable refuse.— Stable litter and manure has been burned with the aid of oil satisfactorily on a small scale, but on a large scale this is difficult and very costly.

At the great remount depot near Fort Sam Houston the complete destruction manure and the complete prevention of fly breeding is a herculean task. The neighboring farmers will not take the manure as a gift, and thousands of dollars worth valuable fertilizer must be destroyed at considerable expense for its destruction.

Latrines.—Latrine pits covered with Havard boxes and burned out daily with crud oil and straw were in general use. The method of spraying these pits with lampblack and coal oil was widely experimented with and received universal approva It possesses many advantages over the method of daily burning out. It takes les time, is not more costly, and is more efficacious in preventing fly breeding. Absolutely fly-proof pits and boxes are almost impossible to construct and maintain Either from the nature of the ground, the edges of the pits become irregular, or th wooden boxes warp and crack from exposure. The use of the lampblack mixtur deters the entrance of flies even in latrines that are not fly proof, and the metho is now in wide use. To diminish the solid content of the pits, a burning out is advisable at long intervals in order to maintain for a longer time the usefulness of th latrine, but I have no hesitation in recommending the daily spraying instead of th daily burning out as a routine measure.

Shelter.—The troops have been well sheltered in tents, floored and framed, at al large camps. Sheltered latrines, shower baths, kitchen, and mess rooms were als provided. Kitchens and mess shelters were screened. The building and screenin were accomplished with as little delay as difficulty of purchase and delivering material permitted.

Ventilation of tents.—As the cold weather came on, the great importance of ten ventilation became apparent. This is a question which has been rather briefl treated in the textbooks on military hygiene. Reports from Camp Wilson and th mountain region in the western districts of the department have called attention t its very great importance. The incidence of respiratory disease and the occurrenc of pneumonia, as well as the spread of measles and mumps, have been shown to b quite accurately proportionate to the bad ventilation of tents during cold weathe The tendency of soldiers to huddle together around red-hot tent stoves, closing ever inlet for fresh air and every outlet for foul, has proved most difficult to overcom With the framed tents, ventilation from below by fastening a piece of wood (2 by 4 to the outer surface of the wooden wall of the tent on three sides so as to hold th canvas away from the wall at that point, has proved very satisfactory. The ten door provides ventilation on the fourth side. The wooden walls should be mad impervious to fine currents of air so that sleeping men may not be chilled, and th apex of the tent should never be closed entirely by the metal caps furnished. It i quite practicable to modify and so to use these caps as not seriously to interfere wit the egress of foul air and at the same time to protect against rain.

Clothing.—Little complaint of the quality and adequacy of clothing has bee made. There was a shortage of certain sizes in articles of clothing and some dela in supply. Some lots of commercial shoes purchased in open market and sent t the department were clumsy and unsuitable for marching troops. In every cas coming to my notice these defects and shortage in clothes were corrected with th least possible delay.

A general inspection of the feet of the troops in El Paso district was undertaken b direction of the general commanding the district and excellently carried out b Maj. Reno, Medical Corps. Defects were listed and made of record and shoes properl fitted. Such a procedure should be among the very first carried out at trainin and mobilization camps before troops are used for field service.

Lavatory and laundry facilities.—Lavatory facilities in the field are even mor important than in garrison, but are often sadly insufficient. Personal cleanliness the body lies at the root of camp hygiene, and in this climate in summer a daily bod bath is a necessity. At all the permanent camps shower baths were furnished i abundance, and as cold weather came on provision was also made for supplying ho water after more or less vexatious delay in the delivery of material had occurred.

'he question of laundry work for troops in the field is one that, in my opinion, must
solved by the institution of transportable field laundries combined with steam
infection for woolen clothes where necessary. The incidence of typhus fever
ong our troops was and is an ever-impending menace on the Mexican border, as
disease is widely prevalent on the Mexican side. A good and economical scheme
doing regular laundry work for large bodies of troops in the field remains to be
lved and is greatly to be desired.

Vhere typhus fever is to be feared—and if war with Mexico had actually taken
ce, this disease would undoubtedly have been a serious problem for the sanitary
e to cope with—a method whereby large bodies of troops may be bathed, freed
m vermin, and all clothing, cotton and woolen, properly disinfected must be
vised and necessary material kept at hand for prompt installment. A good deal
thought has been given to the subject, but as yet an exact formulation of what
thod is most practicable, efficient, and economical has not been made. For-
nately, the need did not arise for the use of a plant among our troops. At all the
ncipal international crossings on the border where our troops were most concen-
ted and where danger of typhus was greatest, such delousing and sterilizing plants
re constructed and maintained by the Public Health Service, and it was not neces
y for the Army to duplicate the work. Had the troops been called upon to enter
xico in force, a portable plant to be carried on a train or motor truck for removing
min from body and clothing would have become a necessity.

At Columbus, N. Mex., the base of the expeditionary column which was in Mexico
over 10 months, it was necessary to free from vermin many Mexican laborers
ployed upon the roads forming the line of communications. Altogether between
) and 700 were treated. An inexpensive plant in which an individual and his
thing could be effectively handled in 20 minutes was installed and managed by
j. L. L. Hopwood, Medical Corps, the district sanitary inspector.

INSTRUCTION OF SANITARY TROOPS.

3y Memorandum of Instruction for Medical Officers and Sanitary Units, published
headquarters Southern Department August 12, 1916, a systematic scheme of train-
was outlined, which was carried out faithfully as far as circumstances at the differ-
camps permitted. District sanitary inspectors were in charge of this training,
ich contemplated not only the instruction of junior officers and enlisted men by
imental surgeons and commanding officers of ambulance and field-hospital com-
nies, but also conferences, lectures, map problems, and war games.

HEADQUARTERS SOUTHERN DEPARTMENT,
Fort Sam Houston, Tex., August 12, 1916.

Memorandum of instruction for medical officers and sanitary units.

SECTION I.—GENERAL.

. The present mobilization affords a unique opportunity for the training of medical
icers and enlisted sanitary personnel, especially of the Organized Militia and Medi-
Reserve Corps, in the functions of the Medical Department on field service.
Full advantage will be taken of this opportunity, and the following scheme of
truction will be carried out progressively and systematically.

. *Participants in course of training.*—This course of instruction is compulsory for
medical officers of the Organized Militia and for all officers of the Medical Reserve
rps on duty with regiments and sanitary units.

3. Commanding officers of base, camp, and cantonment hospitals will see that
icers of the Medical Reserve Corps on duty with their formations take such part
this course of training as will not interfere with the effective performance of their
fessional duties.

4. Junior medical officers of the Regular Army will take such part of this instruc-
n in addition to that required by Section III as relates to subjects in which, in the
inion of their immediate seniors, their knowledge is deficient.

5. Enlisted sanitary personnel of the Organized Militia on duty with regiments
d sanitary units will take the course of instruction here prescribed.
The enlisted personnel of the Regular Army will take the course of instruction
escribed in Section III and such other parts as district or division commanders may
ect.

. *Direction of medicomilitary instruction.*—District or division commanders will
ign the officers necessary to serve as instructors and designate their duties. They

will require attendance on the course by officers and enlisted men as prescrib herein. They will provide for suitable field exercises, marches, and the solution medicomilitary problems by sanitary units and detachments, and will determi the places, dates, and hours for drills, exercises, conferences, and field problems call for by this order.

7. *Supervision of medicomilitary instruction.*—The district or division sanitary i spector will, under the district or division commander, be responsible for the effecti carrying out of the training prescribed in this order.

He will arrange all details, furnish his commander with the names of officers desir as instructors, make plans for all field work, and provide the necessary problems f solution.

In making his inspections he will give careful attention to the manner in whi the provisions of this order are carried out, and will report to this office, through h commander, regarding the results attained.

8. If troops are organized into divisions, sanitary inspectors of divisions will ta over the function of training officers as assigned to district sanitary inspectors in th order.

9. *Instructors.*—Senior or specially qualified medical officers of the Regular Arm selected officers of other branches of the service, and selected medical officers of th Organized Militia will act as special instructors in the course of training.

10. *Responsibility for training.*—The senior medical officer with each regiment an the commanding officer of each ambulance company and field hospital is direct responsible for the training of his junior officers and enlisted sanitary personnel und him.

SECTION II.—GENERAL TRAINING OF MEDICAL OFFICERS.

11. *Outline for instruction for officers.*—The medicomilitary training of medical of cers will include:

(*a*) Practical work in drilling and instructing the enlisted sanitary personnel in various duties.

(*b*) A course of systematized reading and recitations in publications regulating th medical service.

(*c*) Practical training in the preparation of papers and records.

(*d*) Practical training in applied personal hygiene and camp sanitation.

(*e*) Evening conferences, including lectures, discussions, map problems, and w games.

(*f*) Practical training in medicomilitary field work and sanitary tactics.

(*g*) Familiarization with ambulance companies and field hospitals.

(*h*) Familiarization with camp and base hospitals.

(*i*) Familiarization with hospital trains.

(*j*) Equitation.

(*k*) Marching.

12. *Drill and instruction in first aid.*—To familiarize medical officers with marchin litter, ambulance, and tent-pitching drills, and with first aid drills, every such exe cise by enlisted men will be personally directed by one or more medical officers.

13. *Instruction in regulations, manuals, etc.*—The senior medical officer with ea regiment, ambulance company, and field-hospital company of the Organized Milit will take measures to insure that all medical officers with his detachment or compa are thoroughly informed, as soon as possible, with the provisions of Army Regul tions; general orders and circulars, in so far as they relate to the sanitary servic Field Service Regulations; Manual for the Medical Department, 1916; Manual f Courts-Martial; Drill Regulations; and Service Manual for Sanitary Troops, 1914. M reading and the use of the compass will be practiced until all officers can read ma orient themselves, and take advantage of terrain.

To this end he will prescribe a systematic course of reading, may designate regul hours for this purpose, and will check up progress by oral quizzes at least once week

When he and his officers are properly qualified in this respect, the senior officer w report the fact in writing to the district sanitary inspector, who will verify th knowledge in the course of his inspections.

14. *Instruction in papers and records.*—This is covered for officers in paragraph 35 this memorandum.

15. *Training in sanitary inspection.*—For the purpose of instruction in the natu scope, and methods of sanitary inspection of camps, the district sanitary inspec will detail at least two medical officers of the Organized Militia or Medical Reser Corps, by roster, to accompany him on his daily sanitary rounds as assistants.

These officers under instruction will be expected to detect and record any sanita defects and recommend appropriate remedy in each case. The district sanita inspector will note and mention at the time any omissions or fault and will correct mplete any recommendations of remedy. To this end he will question his assist- ts freely to make sure that defects and their methods of correction are fully under- ood. The written sanitary report for each camp will be prepared for the signature the district sanitary inspector by his assistants.

16. *Familiarization with field-hospital and ambulance companies.*—Medical officers on ty with regiments of the Organized Militia will be attached, by roster, by the dis- ict commander on recommendation of the district sanitary inspector, to field-hospital d ambulance companies for the purpose of familiarizing them with the organiza- on, functions, and administration of these sanitary units. The period of such tachment will ordinarily be not less than five nor more than seven days. hile so attached medical officers under instruction will be directly under the ders of the commanding officer of the sanitary unit to which they are assigned and ill perform such duties as the latter may direct. Ordinarily not more than three edical officers under instruction will be attached to a sanitary unit at any one time.

17. *Familiarization with camp and base hospitals.*—Commanding officers of camp and se hospitals will arrange with district sanitary inspectors for inspection of their spitals by medical officers at convenient dates, and will see that the latter have oper opportunity to inform themselves as to the organization, equipment, and ministrative methods of these institutions.

18. *Familiarization with hospital trains.*—Every medical officer will, at the earliest acticable opportunity, visit a hospital train and thoroughly familiarize himself with s equipment and methods.

As far as possible medical officers will visit the hospital train in groups to facilitate e work of description and explanation by the personnel of the latter.

19. *Equitation.*—Every medical officer not versed in horsemanship will be required ride not less than one and one-half hours daily until properly qualified. When acticable, such medical officers will ride in groups under direction of a com- etent instructor.

Senior medical officers with regiments and sanitary units will take measures to see at this requirement is strictly carried out.

20. *Marches.*—For practice in marching as many officers as practicable will accom- any their sanitary detachments or units on the marches required of the latter. In is connection, they will give special attention to the fitting of shoes and the care of e feet.

CONFERENCES.

21. *General scheme.*—There will be not less than two evening conferences for all medi- l officers weekly. Each conference should include three parts, as follows:

(*a*) A lecture by medical or other officers on a prescribed subject, to last 45 minutes.

(*b*) A period for the general asking of questions and discussion of doubtful points, last 15 minutes.

(*c*) The solution of one or more map problems or the playing of a war game on a rge-scale map, illustrating various phases of general and sanitary tactics.

22. *Lectures.*—The following lectures, of 45 minutes duration each, will be given at nferences by selected medical officers:

(1) The organization and function of the Medical Department for war.

(2) The status of medical officers and the relation of the Medical Department to the st of the Army.

(3) The sanitary administration of camps.

(4) Field Service Regulations, in so far as they relate to the Medical Department.

(5) The Manual for the Medical Department, 1916, in its relation to field service.

(6) Customs of the service.

(7) The mechanism and methods of evacuating the disabled in war.

(8) The nature, purposes, and functions of the formations of the Medical Depart- ent for the relief of the disabled in war.

(9) The methods of the Medical Department in securing its equipment and sup- lies and in replenishing the same in the field.

(10) The organization, function, and management of base and general hospitals.

(11) The organization, function, and methods of the American Red Cross for war.

(12) Such other lectures on military and medicomilitary subjects as may be desir- ble will be given as opportunity presents.

23. *Discussions.*—These will be had on any subject of practical general importance n which information or inquiry is desired by persons in attendance at the conference.

This period of general discussion will ordinarily be limited to not exceeding 20 inutes, in order that the general scheme of instruction at conferences may not be nduly interfered with.

24. *Map problems and war games.*—At least one map problem or a war game, illustrating various phases of general and sanitary tactics, will be played at each conferenc by designated officers.

Maps of Fort Leavenworth and vicinity or Gettysburg, of 3-inch (or larger) scale t the mile, with the necessary markers, will be used. The necessary material for thi purpose will be provided by district commanders. The latter may also assign lin officers to assist the district sanitary inspectors in the preparation of these problem and the management of war games.

Map problems and war games will be progressive from the battalion through th reenforced brigades and including the division and will be arranged so as to emphasiz the use of sanitary detachments and sanitary units as much as possible.

25. *Attendance at conferences.*—This is compulsory for all medical officers of th Organized Militia, officers of the Medical Reserve Corps, and officers of the Medica Corps of less than 10 years' service, unless specifically excused by their superiors b reason of duty.

Officers of other branches of the service are invited to be present at conferences an take advantage of and participate in the proceedings.

SECTION III.—PRACTICAL FIELD EXERCISES.

26. The field exercises prescribed under this section are required alike of medica officers and enlisted sanitary personnel on duty with regiments and sanitary units c the Regular Army and Organized Militia.

As far as practicable Medical Reserve Corps officers and officers of the Medica Department of the Army of all grades will be in attendance.

27. *Field problems.*—There will be a number of sanitary field problems carried ou by the sanitary personnel appropriate in general nature to the sanitary detachment or units whose functions are to be demonstrated. These problens should be progressively increased in magnitude and number of units concerned. They shoul include dispositions on the march, in positions in readiness, in the attack, in th defense, and in the rencounter.

A sufficient number of printed copies of the situations to be solved will be distributed, so that proper information of the objects to be attained may be had.

28. *Conjoint problems.*—When regiments solve problems the sanitary detachmen of each will play its proper part in relation to the combatant troops to which it belongs

District commanders will require that in large problems ambulance companies an field hospitals shall participate.

These conjoint problems will be solved in two stages:

The first stage, in which the tactical situation is the dominating factor and in whic the activities of the troops are accompanied or followed by the appropriate sanitar dispositions.

The second stage, in which the tactical situation has been solved and the arrangements for the disposition of the wounded become the predominant factor.

Commanding officers of the combatant troops engaged will make such dispositio of these troops as will enable the sanitary units to carry out the second stage of thes exercises.

29. *Night problems.*—In modern war most of the work of first aid and evacuatio of the wounded can only be done under cover of darkness. A sanitary problem wi therefore be solved at night, in the dark of the moon, at least once a month. Thi problem will be of sufficient magnitude to require the use of at least one ambulanc company and field hospital company.

An appropriate number of soldiers, without arms, should be designated and tagge as wounded and distributed over a mapped terrain under conditions approximatin those of war.

The problem should include the making of contact by the sanitary units with th wounded, the transmission of orders, the searching out of wounded, appropriate fir aid, and the actual transportation of the wounded to dressing stations, and thence t the field hospitals.

30. *Attendance as observers.*—When parcticable medical officers and enlisted san tary personnel not engaged in other urgent duties will be in attendance on field exe cises as observers.

Measures will be taken to inform them of the nature, purposes, and phases of th field exercises, so that they may gain the greatest benefit from their observation.

SECTION IV.—TRAINING OF ENLISTED SANITARY PERSONNEL.

31. Enlisted sanitary personnel will be given not less than five hours' instruction ily. On Saturdays, beside the required formal inspection, two hours' instruction ill be given. Sunday will be observed as a day of rest.

This instruction will be imparted:

(a) By reading and recitations in the Soldier's Handbook, Army Regulations, anual for the Medical Department, Drill Regulations and Service Manual for Sani-ry Troops, and Mason's Handbook for the Hospital Corps.

(b) By drills and demonstrations.

(c) By participation in practice marches and maneuvers.

32. *Subjects for instruction.*—Instruction under class (a) will include: (1) Disci-ine; (2) duties of the soldier; (3) bearer and ambulance drill; (4) first aid, including andaging, splinting, and the treatment of common emergencies; (5) personal hygiene id the elements of camp sanitation; (6) anatomy andphysiology; (7) nursing; (8) ganization and operation of the sanitary service in the field.

Men qualified in one or more subjects, on being so certified by the senior medical ficer in writing, may be excused from further instruction in these subjects. (b) The aining by drills and demonstrations will include foot and litter drill; use of first-aid acket; use of individual equipment of the Hospital Corps soldier; treatment of ounds and fractures; treatment of common emergencies; transportation of the isabled; pitching and striking tentage; packing and unpacking equipment and the se of the articles thereof; the care of property; driving; equitation and the care of nimals; harness and vehicles. (c) Instruction by practice marches and maneuvers. his subject is covered by Section III of this order.

INSTRUCTION IN OTHER SUBJECTS.

33. *Setting-up exercise.*—Sanitary personnel will be given at least 10 minutes set-ng-up exercise daily.

34. *Practice marches.*—Sanitary personnel of regiments and ambulance companies nd field hospital companies will make a practice march of not less than four days' uration and not less than 40 miles in length at least once a month. During this ractice march, daily sanitary maneuvers will be held.

35. *Instruction in paper work.*—For the purpose of insuring the proper preparation nd maintenance of the required papers and records, a properly qualified noncom-issioned officer of the Medical Department will give each sanitary detachment and rganization of the Organized Militia one day of instruction monthly. All noncom-issioned officers and such privates as may be designated will report for this instruc-ion. So far as practicable, medical officers will be in attendance at the time of uch instruction and secure its benefits.

36. *Practical instruction in hospital work.*—Commanding officers of base, camp, and antonment hospitals will arrange for the attachment to their hospitals, as super-umeraries, for practical instruction in the care of the disabled, of enlisted men of the anitary service not experienced in this respect, from troops in their vicinity. Such umbers should be so attached from time to time as can be given instruction without letriment to hospital purposes.

The surgeons of regiments and the commanding officers of field hospital companies nd ambulance companies will submit lists to district commanders, showing the ames and rank of enlisted men of their commands who need to receive such practical raining.

District commanders will authorize the attachment to hospitals, for the above urpose, of such number of enlisted men whose names appear on the above lists as he interests of the service may require.

The period of attachment to hospitals for purposes of instruction should not be less than two weeks. From the necessity of giving some degree of training to as large a number as possible in a brief period, it should not exceed three weeks.

Enlisted men attached to hospitals for the above purpose will ordinarily be quartered and subsisted therein, but will be mustered with their proper organization.

Commanding officers of hospitals will systematize the course of training for enlisted men attached thereto, to the end that they may receive as much instruction as possible in the care of the sick and the treatment of injury.

37. *Instruction with field hospitals and ambulance companies.*—The provisions for this subject covered in Section II, paragraph 16, will apply also to enlisted sanitary personnel. One noncommissioned officer and two selected privates from each regiment will be so attached to field hospital and ambulance companies. The necessary arrangements will be made for their subsistence and quarters with the sanitary unit to which they are attached.

38. *Instruction as cooks.*—For the purpose of instruction in preparing the ration selected men will be assigned by roster as assistants to the cooks of their organizations for periods of not less than 7 nor more than 10 days.

39. *Instruction as chauffeurs.*—In ambulance companies and field hospital companies which are provided with motor ambulances or motor trucks, selected sober and reliable privates and privates first class, to the extent of 50 per cent of the enlisted strength of each such organization, will be given systematized instruction in the operation and care of motor cars.

SECTION V.—SANITARY INSTRUCTION OF COMBATANT TROOPS.

40. This will include (*a*) lectures and demonstrations to militia line officers; (*b* lectures to militia enlisted men.

41. *Instruction of line officers.*—Not less than six lectures on camp hygiene and disease prevention under present and possible conditions, and two demonstrations and lectures on the use of the first-aid packet, will be given to all line officers within one month after receipt of this memorandum.

Lectures on hygiene and sanitation will include the disposal of excreta and refuse camp police; the care and preparation of food; cleanliness of person, clothing, and bedding; the destruction of insect pests; the prevention of infectious diseases, including typhus fever.

Lectures and demonstrations on first aid will include wound infections, the use of the first-aid packet, bandaging, the improvisation of splints, the improvised transportation of wounded.

42. *Instruction of enlisted men.*—Not less than three lectures will be given al enlisted men, without delay, on personal hygiene, the elements of camp sanitation and the prevention of the commoner camp diseases, including venereal diseases acoholism, typhus fever, etc.

The senior medical officer with each organization will provide for this instruction.

It was soon discovered that instruction was most imperatively needed in preparation of papers and record, so that the efforts of sanitary inspectors were chiefly directed to this end.

Practical experience in marching and maneuvers throughout the department was gained by nearly all the regiments.

An excellent series of map problems and maneuvers for sanitary troops was planned by Col. E. L. Munson, division surgeon, Twelfth Provisional Division, and carried out most successfully at Leon Springs, November 18 to 29, inclusive. The division commander took an active interest in the plan and furnished a battalion of Infantry and another of Signal Corps to cooperate in the work. A report on the maneuvers has been rendered by Col. Munson.

CONSTRUCTION OF HOSPITALS.

For the treatment of the sick of the large force in the Southern Department, it was found necessary to construct as rapidly as possible fixed camp hospitals, in which al classes of sick and injured could receive final treatment under conditions as favorable as those existing in modern civil hospitals throughout the country.

The two existing base hospitals at Fort Sam Houston, Tex, and Fort Bliss, Tex. of about 200 beds each, were enlarged by the addition of wooden pavilion wards and increased to the capacity of 750 and 900 patients, respectively.

Hospitals ranging in capacity from 100 to 500 beds were erected at Brownsville Llano Grande, McAllen, Laredo, Eagle Pass, Fort Clark, Del Rio, and Marfa, all in Texas; at Deming, N. Mex., and at Douglas and Nogales, Ariz.

A cantonment hospital partly under canvas existed at Columbus, N. Mex., at the beginning of the mobilization.

A standard unit building was used, 100 feet long by 20 feet wide having ridge ventilation and 8-foot porches on all sides. The buildings were screened from insects lighted by electricity, and supplied with running water. As winter came on, the buildings were weather-proofed against the cold and heating arrangements by stoves installed.

The equipment of the hospital was on hand before the buildings were ready to receive patients. It comprised all the standard furniture, instruments and supplies of regular post hospitals in the Army, including perfectly equipped operating rooms and X-ray machines. Female nurses were on duty at all but a few of the smallest hospitals.

SERVICE OF HOSPITALS.

eports from all the base and camp hospitals accompany this report and give details he service of each. It is a record of good work and excellent results of which the ıy has no cause to be ashamed.

he surgery was uniformly efficient and all classes of major operations were per- ıed.

LABORATORIES.

he service of the three department laboratories is set forth at length in the accom- ying reports from these institutions. The routine work is enormous, but much cial research has been made, most of which has been the subject of special reports is alluded to elsewhere in this communication.

t is believed that important addition to our knowledge of paratyphoid fever, umonia, cerebrospinal meningitis, and other infections has been gained.

mong the important points to be decided in raising the contemplated great Army he United States, upon which the work of the laboratories in this department have wn much light, are:

. The necessity for compulsory vaccination against paratyphoid fever of all troops.

. The necessity for special equipment and construction of laboratories at large ld weather" camps for the differentiation of pneumonia microbes, so that special m therapy may save the lives of many of the sick.

. The detection and cure of hookworm at mobilization camps of all troops from cted sections of the United States.

. The handling of carriers of disease, who are themselves physically able to do duty.

SUPPLIES.

Vith the exception of field dental equipments, which were not purchasable in the ited States on time, and some articles of combat equipment which were equally btainable, all classes of medical supplies were on hand and promptly furnished on uisition.

he medical supply depots at San Antonio, Tex., and El Paso, Tex., were excel- tly managed to the satisfaction of the authorities.

MEDICAL DEPARTMENT CLERKS.

pecial mention is due to the faithful and efficient services of the clerical force in office and especially to the chief clerk, Mr. John W. Cleave.

his force of classified clerks, Medical Department at large, temporary clerks engaged the emergency caused by the mobilization of last summer, and of noncommissioned cers and privates of the Medical Department, has been most efficient in keeping east of the large mass of work handled by the office of the department surgeon, l in meeting emergencies.

he status of clerks of the Medical Department should, in all justice, be equalized h that of field clerks of The Adjutant General's Office and the Quartermaster Corps. ng and faithful service at home and abroad should meet at least with no less reward n has been given to the same class of service in other staff departments.

The Division Surgeon, Eleventh Provisional Division, reports as llows:

he Eleventh Provisional Division consists principally of the National Guard anizations from the States of Ohio and Michigan, with a few scattering organiza- ns from other States. The only representatives of the Regular Army are a few staff cers at division headquarters and the inspector instructors on duty with the different giments. Although two regiments of Infantry from Michigan have been in the cinity of El Paso since July, the division proper was not organized until about ptember 10. A large proportion of the personnel comprising the organizations are n possessing limited experience in camp life; in fact, it is safe to say the majority ver experienced conditions of this kind before. After the call of the President majority of the organizations were greatly depleted owing to the mustering out of ny of the older members due to physical and other disqualifications. As a result ranks were filled by untrained men. The general morale of the personnel com- ising the division is very good, the majority of its officers and men being of high liber.

The general criticism to be offered, however, is the inexperience and lack of intere displayed by many of the organization commanders relative to sanitary matters ar conditions concerning the health of their men. Although rigid sanitary rules ar regulations have been published, but few of the organization commanders ha familiarized themselves with them and endeavored to carry out their provisions.

CAMP SITES.

This division occupies two separate and distinct camp sites, entirely different as soil conditions and surroundings. The main body is camped on a rocky plate about 3 miles north of the city of El Paso. The site is bounded on the west by t Franklin range of mountains, on the east by the Fort Bliss mesa. The soil is rock barren, and void of vegetation. The territory is laid out into city lots and its occ pancy by the military was with the understanding that no latrines or pits would dug except in the streets. As a result some of the camps are somewhat congeste In many places the camp is built on solid caleche or rock and the placing of tent pe is almost impossible. All latrines and pits of any kind had to be blasted.

The camp site of the Michigan regiments is of a different nature, being located on low sandy level between the Rio Grande and the irrigation ditch east of the cit While the main body of the division camp is established in a good residential secti of the city, the Michigan camp is surrounded to a large extent by Mexican shacks a questionable houses.

WATER AND FOOD SUPPLY AND DISPOSAL OF WASTES.

The food supplied was satisfactory, both as to quantity and quality; a few co plaints were made relative to some commodities, but on investigation proved to groundless. The water was furnished by the El Paso Water Works and although t quality of the water was satisfactory, many complaints were made from time to ti relative to the diminished supply. This was especially true of the provisional re ment of Field Artillery, which at times has been deprived of water entirely.

MEDICAL PERSONNEL OF THE DIVISION.

The commissioned personnel of this division consists of 14 majors, 26 captains, first lieutenants, 8 dentists, and 3 veterinarians. The large majority of the medic officers in this division are highly educated and successful practitioners in their spective communities. They have appeared interested in the work and anxious learn. They were greatly handicapped in their work due to lack of experience a training in military medical matters. The medical officers from Ohio were furth handicapped by the poor instruction received from a noncommissioned officer of t Medical Department of the Army when at the State camp, who knew nothing abo the work and who was not prepared to act in the capacity of an instructor. As result of this they were compelled to undo much of the work done at their cam This was especially true in making out sick and wounded cards and general recor As a result the first few weeks spent at this camp were very trying and many beca discouraged, which was perfectly justifiable; but by constant work and perseveran on their part they have mastered many of the difficulties and at present the work progressing satisfactorily.

There are 650 enlisted men in the Medical Department. Of this number one priva died of pneumonia, one was transferred to a line organization and four were furlough to the reserve. As a rule the enlisted personnel of the Medical Department consi of a high class of men, many of them being doctors, dentists, lawyers, medical studen etc. These men, like those of the line organizations, lacked instruction. This w especially noticeable of the majority of the noncommissioned officers. Special me tion might be made of the rapid progress of the field hospitals and ambulance co panies. Considering these organizations had never been trained as such and th prior to reaching El Paso the majority of their members had never received traini with animals, too much can not be said of the rapid progress made in rounding o these organizations after their equipment was complete. A sergeant from one of t Regular Cavalry organizations stationed at Fort Bliss was assigned to each compa for 15 days, after the animals had been furnished and the work performed by the was excellent.

ANIMAL AND WHEEL TRANSPORTATION.

he following animal and wheel transportation is assigned to the medical department of this division:

ing horses	234	Wagons	44
bulances	49	Pack animals	30
ft animals	390	Automobiles	1

REQUISITIONS.

inety requisitions were submitted by the medical officers of this division, as ows:

ld hospitals	21	Eighth Ohio Infantry	5
bulance companies	12	Engineers	4
ond Ohio Infantry	5	Cavalry	5
rd Ohio Infantry	5	Field Artillery	5
rth Ohio Infantry	7	Signal Corps	5
h Ohio Infantry	5		
th Ohio Infantry	11		90

s a rule all requisitions were honored expeditiously, and little complaint was rd from medical officers relative to this matter. There has been some difficulty btaining certain supplies, but in no case has the health of the command suffered een impaired. It was impossible to obtain proper dental equipment during the few weeks, but this condition was unavoidable, due to the fact that the dental ply houses could not furnish equipment. At the present time all dental surgeons e their equipment and are doing excellent work.

CLIMATIC CONDITIONS.

he climate might be considered mild, although some exceptionally cold periods e been experienced from time to time; fortunately, however, these cold spells e of short duration. As a rule the days are warm and the nights cold. During the few weeks several severe rainstorms were experienced, but of late there has been le rainfall. Wind and sand storms are common, during which camp life is remely disagreeable.

PREVAILING SICKNESS.

he prevailing sickness in the division appeared to be mostly of a trivial nature, h as slight colds and catarrhal diseases of the respiratory system.

VENEREAL DISEASES.

he venereal rate in the division was very low. This condition was believed due the high standard of morale of the men and to the immediate establishment of phylactic stations throughout the division. Immediately upon the arrival of anizations, organization commanders and the medical officers were assembled the division surgeon and told of the venereal conditions in and around El Paso, l instructed to notify the men at the first formation of such conditions. The dical officers were directed to immediately establish prophylactic stations. Veeal inspections are made bimonthly, and report is made to the office of the division geon.

DEATHS.

here have een 24 deaths in the division- 15 caused by pneumonia, 1 tubercuis, 1 diabetes, 1 drowned, 1 anemic dysentery, 1 run over y vehicle, and 4 gunshot unds (2 accidental, 1 suicidal, and 1 homicidal).

HEADQUARTERS, TWELFTH PROVISIONAL DIVISION, CAMP WILSON, TEX.

CAMP SANITATION.

This camp, situated to the northeast on the outskirts of the city of San Antoni has the advantages of good natural drainage for surface water, good climatic conditior accessibility for supplies, environs free from nuisances, and an excellent and amp water supply.

The soil of the camp site is mixed gravel and gumbo clay, which in wet weath makes a deep, sticky mud. During the summer of 1916 there was an unusually lar amount of rain. The camp site was at times very hard to keep clean.

Surface water drainage has been facilitated by a system of ditching which serv not only to rid the camp of rain water but also to carry off waste water from the ba houses. This is of great importance, as during hot weather a great quantity of wat is used for bathing and washing clothing.

There is no system of sewerage. It would be difficult to install a sewerage syste for the camp, which would not be objectionable, without great expense. The sewe for the part of the city near the camp are already taxed to their full capacity and c not be used for camp drainage.

There is some question as to the desirability of having such a system for a milita encampment. Its convenience is offset by the fact that troops sent to the encam ment for training should learn how to do without conveniences which it will be i possible for them to have in active service. It is important as part of their traini that they learn sanitary methods for care and disposal of wastes.

Police of camp environs has as a rule been very good. Early in the summer the were a number of small stores, restaurants, and fruit stands near the entrance of t camp which were not well kept. The health authorities of the city of San Antor took the matter in hand. Scavengers removed refuse daily and inspectors from t health department were specially assigned to the district. The results have be good.

The San Antonio police department as well as the health department cooperat with the authorities of the camp. Objectionable characters were not allowed in vicinity. Measures were taken for suppression of prostitution. Soliciting in t vicinity of the camp was prohibited. Plain-clothes men made frequent roun to see that the prohibitions were enforced.

Climatic conditions.—During the summer the heat was at times great. It w seldom over 95°, usually not over 85° in the hottest part of the day. There was neai a "Gulf breeze" in the afternoon. The heat was not great enough to interfere with t proper training of troops. During the months of June, July, and August drills we suspended during the hottest part of the day. None of the men suffered any hardsh or injury on account of the climatic conditions. There were a few cases of heat pr tration, none of a serious character. The number of heat prostrations was no grea than would occur in summer camps in northern States. The summer temperature Illinois was hotter during the summer of 1916 than that of San Antonio.

During the months of November and December there were several northers, whi caused sudden drops in temperature and considerable discomfort. There were cases of bronchitis in the First Mississippi Infantry Regiment reported in one we following exposure in a norther while the regiment was en route from Leon Sprii to Camp Wilson. None of these cases were of a serious nature. The rest of the co mand had no rise in sick rate due to this cause.

Taken throughout the year, the climatic conditions of Camp Wilson are admiral adapted to the requirements for a camp of instruction. There is no prolonged peri during which the troops can not be given field exercises. With reasonable attenti being paid to the climatic conditions, avoidance of strenuous exercises during the h of the day in summer and suitable attention to heating of tents during the col periods in the winter months, men of the command may be expected to maint excellent health.

Food and its preparation.—The food supply for the command has been excelle Articles furnished by the Quartermaster's Department have been of good quali The quantity has been ample. There has been a sale to some of the organizati of meats that were not United States inspected and passed. This matter is n under consideration and suitable action will be taken.

An attempt was made to have these articles purchased through the Quartermaste Department, but as they could be purchased only as "exceptional articles" and method of purchase of articles of this class is too difficult, deliveries are too slow, a the regulations require that the articles so purchased must be accepted regardless the condition of delivery, it was impracticable to buy meats in this way. The me in question include veal, pork, and sausage. They have been purchased from lo

ers. Some of the meats so purchased are of good quality. There is, however,
guaranty of their fitness for consumption unless prepared under United States
ection.

he preparation of food by militia organizations has not been as good as by regular
ps. This is due to lack of experience. It has been made a matter for instruction
in commands which have been a short time in camp great improvement has been
d. Preparation of food improves both as regards handling of the ration in making
meals better balanced, more appetizing, and also as regards economy in use of
ration. In new organizations there is enormous waste of food.

ilk supply.—In many of the kitchens none other than condensed milk is used.
re is some fresh milk sold in the camp.

he condition of dairies was made a matter of investigation. There were no
rs issued on the subject. Recommendation was made that fresh milk be pur-
sed from certain sources which were known to be good.

he milk supply of San Antonio is under a good city inspection. Milk is con-
ally inspected and dairies are scored and the scores published monthly in city
spapers.

nspections were made of soda bottling plants and of the plants of firms which
ished ice cream to the camp exchanges. During the summer months immense
ntities of ice cream were sold in the camp, as well as an immense amount of
led soda. Information was given purchasing officers for post exchanges as to the
s which were preparing these articles under good conditions.

itchen incinerators.—During the first two months—July and August—incinerators
he horseshoe type, rock lined, were used. They were not satisfactory. It was
rly impossible to evaporate in them the waste water from the kitchens.

ncinerators of the horseshoe shape worked well at the camps at Leon Springs and
Braunfels, but were not a success at Camp Wilson. At the Leon Springs and New
unfels camps the soil was rocky. There was not the clay which is found at Camp
son. Large stones, which retained heat and aided in evaporation of liquids, were
ly obtained. At Camp Wilson it was difficult to find enough large stones to line
inside of the incinerators. Small stones did not hold the heat. The soil was
rly impervious. There was little seepage of liquid through it. The clay on the
s of the incinerators became mixed with liquid kitchen waste and was saturated
some distance from the fires. It was kept warm by the fire and became an ideal
e for hatching and breeding flies. It was possible to dig maggots from the earth
he sides of nearly every such incinerator. The rock-lined incinerators work well
ocky or in sandy soil, but are not a success in a soil of gumbo clay.

rick incinerators with evaporating pans were installed at each company kitchen
ugust. They were much easier to care for than were the old ones. There was less
culty from flies after their installation.

ncinerators of this type are now in use. They can be used effectively for disposal
kitchen waste. They are extravagant in fuel consumption; with moderate cost
ld be covered over, closed in, and have garbage chambers made. The cost of
h improvement would be many times saved in lessened fuel consumption. They
not good incinerators, but are better than those formerly used.

ly destruction.—During the summer months there were quite a number of flies
ut the latrines and kitchens. Vigorous measures were taken to rid the camp of
ir presence. The sources were from breeding places outside and inside the camp.
t Remount Station No. 2, 1 mile distant from the camp, there were kept on an
rage from 4,000 to 6,000 horses and mules. This station was not well policed at
and there were flies by the millions. The prevailing winds were from the direc-
of the remount station. Flies drifted into the camp in swarms. There were
flies bred in the camp in the incinerators and on the ground about, when the
k-lined type of incinerators was used. There were some flies bred in the latrines,
ugh not in great numbers.

t was difficult at first to teach the more inexperienced men the necessity for scru-
ous cleanliness of the kitchens and surroundings. They learned it after a time.
wever, as scrupulous cleanliness means a great deal of work, there was always
ural inertia to be overcome in order to maintain good sanitary camp conditions.

atrines were burned out daily and during some periods twice daily. Hot fires
e needed in order to destroy all fly eggs and maggots in the latrines. Several of
latrine buildings were burned down during the process.

here were over 600 flytraps in use throughout the camp. Kitchens were fre-
ntly inspected and attention given to seeing that the traps were used and kept
perly baited. Thousands of sheets of fly paper were used. Fly-breeding areas
e burned over with hay and crude oil. Fly poison was supplied and used in the
hens.

At Remount Station No. 2 there was an antifly campaign. A detachment of Medi
Department enlisted men under charge of a medical officer was put at work. Civili
employees were put at work cleaning up the paddocks. There were 30 men employ
at this work. Several thousand sheets of fly paper were placed about the buildin
Five hundred plates of bread soaked with fly poison were placed about the stab
and kitchens. The poison, 4 per cent formalin with sweetened water and condens
milk, was very effective. Ten gallons of dead flies were gathered from a small a
where they were thickest. Another effective method for fly destruction is a spray
carbolic or cresol solution used with a tree sprayer. It is used in the evenings wh
flies have settled on screens and walls inside of the buildings. By use of these me
ods at the remount station the number of flies was quickly much reduced. T
number of flies at Camp Wilson was immediately reduced, as there were fewer blo
into the camp.

Latrines and their care.—The latrines used for the camp were pits 14 feet long b
feet deep. They were covered by boxes of a modified Harvard type. Latrine hou
were built about them. The latrines were burned out once daily with straw or
and crude oil. In hot weather during the summer it was found necessary to bu
them out twice daily. Each latrine house was provided with a urinal trough
galvanized iron. This trough was connected with a pipe with the latrine pit. T
inside of the troughs were painted with crude oil, inside, once or twice daily.

There was considerable difficulty experienced in the care of latrines. The boxes u
were not of a good pattern. They were too heavy and clumsy. They could
easily be shifted inside of the houses to allow for burning out the pits. They w
constantly breaking. The sides of the pits were frequently caving in. It was di
cult to keep them fly proof. A great deal of labor was required for their care, ab
50 working hours per day per regiment. Though it was possible by this method
keep the latrines fairly free from flies, the method of latrine management was
satisfactory.

The method of spraying latrines daily with a mixture of coal oil and lamp bl
was used for care of latrines at the camp at New Braunfels (Landa Park), Te
during the latter part of August. It gave better results and was much easier t
the burning method. There were fewer flies about the latrines, the pits were m
easily kept fly proof. When coal oil and lampblack are used, the mixture of 1 pou
of lampblack to 4 gallons of oil is sprayed through the openings into the latrine
The quantity is 1 gallon of the mixture for each pit per day. The boxes remain
place. A film of oil is deposited over all material in the pit, which kills any fly e
that may be deposited. In case the work has been done in a perfunctory mann
not enough of the mixture sprayed into the pits, so that flies are breeding, the
can be burned from time to time. It will be found that there will be enough
and paper in the pit to make a hot fire if the paper is lighted. The box must
removed before the burning is attempted, otherwise it will be burned up. A co
bination of the spraying method with burning once weekly will reduce the amou
of material in the latrine, prolong its use, and at the same time kill any fly eggs
larvæ which may be present. No method for care of latrines is perfect. The spr
ing method has to be used in order to be effective. The work must be done un
responsible supervision otherwise, particularly with inexperienced troops, it
be neglected or not done at all. Treatment of latrines by spraying seems to be
best method yet devised. If carried out with any reasonable care it gives mu
better results and entails much less work than the burning process. There is li
difference in cost between the two methods. Coal oil costs, in this district, bu
fraction of a cent more a gallon than crude oil. There is less waste when the oi
used in sprays. The utility of the lampblack as a component of the mixture is dou
ful. It blackens the inside of the pit and box, making less light in the pit. It m
have some value as a deodorant and perhaps in some way inhibits fly breeding.
cost of lampblack is about 15 cents per pound. Bone black, costing but 8 cents
pound, has been used as a substitute. It is not as good as the lampblack, as it d
not mix well with the oil. It settles to the bottom of the container. If the bo
are fly and light tight it would seem that lampblack could be dispensed with
results practically as good be obtained by spraying with oil alone.

Types of sprays used.—The sprayer which has given the best satisfaction is
"Brown compressed air sprayer," manufactured in Rochester, N. Y. Sprays of
type were of 3-gallon capacity. They are the kind used for tree or brush sprayi
Each sprayer has an air pump for compression. There is a 3-foot rubber pipe w
nozzle. The sprayer is of about the size and has much the appearance of the
extinguishers in common use. There is a webbing strap by means of which the ap
ratus can be slung over the shoulder of the operator. Sprayers of the size mentio
are best, as they can be operated by one man. They are quite simple; less ap

out of order than larger tree sprayers. As more of them are furnished, in case is out of order, others can be used. Two or more men can be spraying different ines at the same time, thus shortening the time for work. Smaller hand sprays e used, but were found to be too weak and to make the process too tedious.

'he Brown sprayers are made in two grades, of galvanized iron and of copper. en oil is used, the galvanized-iron kind is as good as the more expensive copper. difference in cost is $4 for the iron and $7.50 for the copper. The rubber hose l have to be renewed at intervals, as it is rotted by the oil. In case sprayers are to be had, garden sprinkling pots may be used. They are not as satisfactory in t they do not give a fine enough spray.

'he sprays are now in use in the Third Illinois Infantry Regiment. Requisitions e been made for enough sprayers to supply the division in camp at Camp Wilson for use at the subcamps at New Braunfels and Leon Springs.

athhouses.—Bathhouses with shower baths were built for each battalion through the camp, both for use of officers and enlisted men. Each enlisted men's bathise was provided with a "laundry stand." This was an inclined shelf for scrubbing thing. Along the top of the shelf there is a water pipe provided with several cets. When clothing is being washed, fresh water can be run over the inclined lf as desired.

)ne bathhouse for officers and one for enlisted men of each regiment is provided h a heater for furnishing hot water and for heating the house. Work of installation these heaters was not complete at the close of the year 1916. About one-third of regiments have been supplied. The work had been delayed on account of short in the number of heaters and the necessity for first supplying camps which were lated in colder localities. During the hot weather the shower baths are much d. Later in the season, as the weather becomes cooler, there is less bathing. The n of the command, however, deserve great credit for the care they have taken to intain cleanliness, even under adverse circumstances. Men were bathing and ubbing clothing in cold weather in December where the bathhouses had not been ited and hot water was not supplied.

'hysical improvement of the command. During the period of training the physical idition of men of the command has notably improved. This has been very appar, to all who have had opportunity to see the troops at the time of their arrival and iin a few months later. Under camp conditions, with regular training, good food, l life in the open, men have gained in weight and strength. They have acquired ifidence in their ability to do work which may be required of them. They have ned strength, so that they have been able to march and perform work of which y were incapable.

'he time of training has been short. None of the militia commands have been in np over six months. During this short period of training the benefits of training re been great. Could similar training be given young men over a longer period, ater benefits would be gained. Many of the men at Camp Wilson were of mature irs. For them the benefits were not so great as would have been the case had they eived their military experience during the developmental period of life. The ler men had, many of them, assumed responsibilities at home. Protracted absence m their homes caused anxiety. They were anxious to return and so took less erest in their military duties. It is believed that, while all men will derive benefit m military training in camp, by far the greatest benefit will be given the younger n.

The divisional march to Austin, Tex.—During the period from September 16 to Octo r 2 the Twelfth Provisional Division was on march to Camp Mabry, Austin, Tex., d return. On this march the troops were given a valuable experience and many sons of value were learned by both enlisted men and officers.

The division was accompanied by a complete divisional sanitary train. There were o ambulance companies of Regular and two of militia. There was one field hosal of Regular troops (No. 6 motorized). There were three field hospitals belonging the Organized Militia. The march was made for them, as well as for the regimental dical Department detachments, a period of training which closely approximated iditions in actual warfare. One field hospital was pitched each night and the sick the division were evacuated through it to the base hospital at Fort Sam Houston. e number of cases treated in the field hospitals varied from 16 to 155 per day.

The experience of the march brought out the advantage of the motorized field spital over the hospital which has but mule transportation. The advantage conts not only in its greater mobility but also in the superiority of the service which n be rendered by its personnel. Men who have been transported on the march d are relieved from the work incident to the care of animals have energy to devote work of the sanitary organization to which they may be assigned which is manifest in the higher grade of work done by the motorized organization. While excell work was done by the men of the mule-drawn field hospitals, the efficiency was l as compared with the motorized hospital. This was aside from any difference training between the various organizations. It was a natural result of increased cap ity by reason of the fact that the men were not exhausted by a day's march bef commencing to do their special work with the sanitary units.

A great deal of difficulty was experienced in making out the required records sick and wounded. Card forms No. 52 were used and transfer cards were made for cases sent to the base hospital. In some instances men engaged on the cleric work were at work through the entire night, and in nearly every instance the reco were not correct. This was particularly true of the militia organizations, which w not experienced in clerical work. It was demonstrated that for field work, particula with inexperienced organizations, the clerical work required must be of the v simplest, and that even then correct and complete records can not be expected.

Evacuation of the sick was done by motor ambulances. Three hundred and eigh nine cases were sent to the base hospital from camps along the route. The dista to Austin is 85 miles. Without the motor ambulances evacuation to Fort Sam Houst as a base would have been impossible. There were four motor ambulances us Each of them with good roads was able to do the work which it would have requi 12 mule-drawn ambulances to accomplish. There were two cases of acute app dicitis transferred which would not have reached the base hospital in time for succ ful operation had mule-drawn ambulances been used.

During the march 3.307 per cent of the militia troops were sent to the base hospi Many of the men had disqualifications for which they were discharged on certifica of disability. There appeared a number of venereal cases which had been concea while the men were in camp. The presence of defectives with the command h during the first part of the march a demoralizing effect upon other men of the comma When men who had disabilities fell out of line others who were able to march follow their example. With the elimination of the defectives there was a noticeable impro ment in the rest of the command. This was demonstrable not only in the march ability but also in the spirit which was manifest. The men who remained w more cheerful and confident by reason of being relieved of undesirable compani

The necessity for careful weeding out of troops before muster into service was v plain. Though many had been rejected at the time of muster, it was shown t requirements should be even more strictly maintained, not only on account of saving to the Government in anticipating possible pension claims, but in the be discipline and courage of troops which are sound.

Inspection of camp sites left on the march was made by the division inspector the sanitary inspector. The inspections were very thorough and careful records w made. Irregularities were brought to the attention of commanders. During march there was remarkable improvement shown in care of camps. The areas by some regiments were absolutely free from refuse. Only by the brown patche earth where latrines and kitchens fires had been covered could it be known th regiment had been camped on the ground. It was impressed upon all inexperien troops that the health of other commands which might occupy their camping grou or the health of their own command on returning to the old camp sites wo depend upon the way in which camps were left. Men who had contracted slove camp habits were cured.

The experience gained by the Medical Department personnel was particul valuable. Many of the officers and men had never before realized exactly what their function in the Military Establishment. To such persons the realization they had an important part to play in the Military Establishment was most benefic The necessity for the divisional sanitary train was made apparent to many who not known its use. As a result of the experience gained there will probably be sev field hospitals and ambulance companies organized.

The division surgeon and sanitary inspector, Nogales distr reports as follows:

SICKNESS AND MORTALITY.

The first part of this period presented nothing unusual, the average sickness b noted. On the departure of the California Infantry Brigade, the last of October, the arrival of the Alabama Infantry Brigade, field hospital, ambulance company, signal corps company, the sickness began a steady increase. This increase at was due to the large number of venereal diseases that these troops brought with t to this station. These cases were all rounded up and put into the hospital, s 43 being put in at once.

)n arrival of these troops the field instruction immediately began, consisting of ictice marches, etc. The later part of November the Fourth Infantry, and early December the Second Infantry, made practice marches to Tucson and return. ite a marked rise in the sickness began to be noticed at this time, due to respiratory eases (influenza in its different manifestations).

The Idaho Infantry suffered in this respect as well as the Alabama troops. As a ans of reducing the number of cases of influenza, the following recommendations re made:

'1. On December 6 there were in the base hospital 189 cases of respiratory diseases—nitis, none; tonsillitis, 15; bronchitis, 10; pneumonia, 10; influenza, 73; pleurisy, 1. e Alabama Infantry, which had just completed a march to Tucson and return, had der treatment in their camp 86 cases and the Second Idaho 23 cases. And this es not include many cases who have been prescribed for but not taken on sick report.

'2. Investigating the cause, all regimental surgeons express the opinion that most the trouble, if not all, is due to the open mess sheds where the men are exposed to e cold winds of the early mornings and nights.

"3. It should be borne in mind that the temperature in and around Nogales varies much as 50° or more from noonday to early morning. The nights and early morngs are very cold.

"4. The district surgeon and regimental surgeons are of the opinion that the troops ve not sufficient shelter for this altitude and climate, and therefore recommend at steps be taken immediately to close all mess sheds and to floor and wall all nts.

"5. Furthermore, it is recommended that maneuvers and marches should be odified and conducted in such manner as will permit the men to occupy their own nts each night, certainly until the epidemic of respiratory diseases is over.

"6. As an example of the harmfulness of marches at this time of the year in this itude, the sick report of the Fourth Alabama might be considered. During the onth of November, in this regiment, 9 cases of respiratory diseases were taken on k report. From December 1 to date there have been 125 such cases, and it is lieved that these cases resulted directly from the exposure to the cold nights and rly mornings on their return march from Tucson."

Still the epidemic continued, and while the number of cases decreased somewhat e severity of the cases increased, resulting in pneumonia.

During December there were admitted to the base hospital 47 pneumonias, distriuted as follows: First Alabama Infantry, 27; Second Alabama Infantry, 6; Fourth abama Infantry, 10; First Alabama Ambulance Company, 1; Second Idaho Inntry, 1; First California Field Artillery, 1; Utah Cavalry, 1.

During December there were 4 deaths from pneumonia, a mortality of 9.7 per cent.

Various causes have been given by different medical officers as to the comparatively rge number of pneumonias: Unacclimated condition of the Alabama troops; reduced tality of these troops, especially those coming from Mobile and along the Gulf coast, eir vitality having been reduced by malaria and hookworm diseases, the latter sease having been found in the Alabama troops; carelessness in the observance of e rules of personal hygiene; exposure on practice marches and on guard; contact posure in picture shows; contact exposure in the tents; and numerous other causes, hich leads to the conclusion that they have all been factors. And on this assumption ery effort has been made under the circumstances to reduce these pneumonias by tacking every and all causes.

The following recommendations were made, and while some of them were made in nuary, 1917, they relate to conditions in 1916, and therefore it is thought proper to clude them:

"JANUARY 5, 1917.

"As a means of reducing the epidemic of pneumonia and influenza, which has become uite serious, it is recommended that sufficient tents be furnished the Alabama troops give a tent to each four men. This will reduce the liability of contact infection, e principal manner in which the infection is transmitted. Furthermore, each man ould be required to use his own drinking cup, wash basin, and towel. Expectoration and around the tents should be absolutely prohibited. This plan was carried out ith great success by the present Surgeon General in eliminating pneumonia from e laborers on the Panama Canal and the miners in South Africa."

"JANUARY 6, 1917.

"1. The pneumonia situation has reached such a condition of seriousness that it is ought proper to recommend every procedure that will have a tendency to reduce it.

"2. The histories of many of the cases show that they experienced a chilling of their odies, which was soon followed by pain in the side and sickness. Many of these men go to town in the early afternoon with only a sweater, which, after all, is a very po garment for warmth, and going home late at night probably in a jitney they becor chilled. Furthermore, in going to town they usually land in the picture show, whe they inhale an atmosphere impregnated with pneumonia, influenza, and probab cerebrospinal meningitis germs.

“3. Therefore it is recommended that the Alabama troops be not allowed to be abse from their camps after dark, and that all troops be prohibited from attending pictu shows or other places of assemblages until this epidemic of influenza, pneumonia, a measles is over.”

Measles.—Measles, also, has caused a marked morbidity. This disease began assume epidemic form about December 12. By December 31 the epidemic reach its height, 157 cases being in hospital for that cause alone. The First Alabama Infant gave the largest number by far. Cases were isolated for a time in the base hospit and when this hospital began to reach its capacity the Alabama Field Hospital w opened December 17, for the care of measles, mumps, and venereal cases, thus reduci somewhat the pressure at the base hospital.

Cerebrospinal meningitis.—On November 8 a case occurred in the District of Colu bia Signal Corps. Its source could not be determined. It was thought to have be contracted from Mexicans, as the man gave a history of having been in Mexico abo a week before he took sick. In this connection it is of interest to note that on Janua 1, 1917, a case of cerebrospinal fever occurred in Battery D, Sixth Field Artiller This whole battery was examined bacteriologically, with negative findings in eve case, which again leads to the belief that picture shows, where the soldiers come very close contact with a Mexican population that has no medical supervision, is t probable source of this infection.

The Alabama troops gave the largest per cent of sickness. As compared with t Regulars, they gave an average morbidity for December of 8.1 per cent, as against per cent for the Regulars. In the Alabama troops there was quite a difference morbidity and mortality.

It is interesting to note that the ambulance company and the field hospital had small morbidity. This may be due to the fact that these men were better cared f and did no guard duty.

Sanitation.—Sanitation, on the whole, has been excellent throughout the cam The camp sites have been excellent, being on hillsides, thus giving very good dra age. Water was obtained from the Nogales town supply, of excellent quality and sufficient quantity.

Food and its preparation.—This has been excellent, no cases being reported in t camps where the quality and quantity were not what they should be. At the ba hospital, on account of the limited facilities, much difficulty was experienced feeding the large number of patients during the fall. With the installation of t diet kitchen, dish-washing room, and officers' mess room it is thought this will corrected in a large measure.

Incinerators placed near the kitchens have been used to dispose of slops, garba and camp refuse. Manure has been hauled away to the dump pile, several miles fr the camp, and burned. The Harvard box latrines have been in use, being burn out with straw and oil once a day. This latrine has not been altogether satisfacto in this camp, for in many places the pits had to be dug by being blasted into t solid rock. The liquid contents have not been absorbed, and in some cases where was attempted to fill up these pits the earth thrown in only had the effect of pushi the liquid fecal matter out over the brim. In those localities where it is proposed build cantonments these pits will have to be dealt with, either to consume the co tents with a large quantity of quicklime or pumped out and hauled away.

Clothing.—There was considerable complaint in the fall that sufficient clothing w not furnished the troops in this district.

The morbidity and mortality will be more specifically dealt with in the report fr the base hospital, for practically all serious cases and all deaths occurred at th hospital.

The department laboratory.—This institution has been of great value to the distr surgeon and sanitary inspector in making early diagnoses in cases of infection, th giving an early opportunity to stamp out infection. It is believed that the princip function of these laboratories in the future is to aid the sanitary inspector in t sanitary control of infectious diseases.

The surgeon, Base Hospital No. 1, Fort Sam Houston, Tex., repor as follows:

The post hospital at Fort Sam Houston was designated by the Secretary of War the base hospital for the Southern Department on November 3, 1915, and as B ospital No. 1 on September 28, 1916. This hospital was constructed nine years ago d has been added to from time to time since that date. It consists of eight wards, ch ward capable of accommodating 25 patients if proper use is made of the porches, th the usual arrangement of the basement, offices on the first floor, operating room, rary, and dressing rooms on the second floor; room for Hospital Corps personnel d prison ward on the third floor. In addition there are the usual rooms on the sec- d and third floors over the dining room originally intended for housing the hospital rsonnel, but these rooms have been used for patients.

When the militia were called into the Federal service, it was necessary to enlarge is hospital. This was accomplished by building 18 standard temporary wards, a reroom, which contains a room for patients' effects, a linen room, and a small room ed for hospital personnel, a large L-shaped dining room, a kitchen, and the neces- ry toilet and bath accommodations. The temporary wards were constructed in two stallments. First construction consisted of 4 wards, a dining room, a latrine (con- ining 12 closets and lavatory facilities), and a bathhouse consisting of 12 showers. e work on these buildings was begun on June 7 and completed June 25, 1916. The cond construction consisted of 14 wards, a storeroom, an additional dining room, d a kitchen. The work on this construction was begun July 7 and finished August , 1916.

Patients were first received in the four wards constructed on July 5 and in the last wards constructed on July 14.

The temporary wards normally accommodate 30 patients. This number can be creased to 34 without material crowding, and by using the porch 40 patients can be red for in each ward. Counting 40 patients to each temporary ward, the maximum d capacity of this hospital would be 980.

Twenty-eight deaths from various causes occurred during the year.

The operating room in the post hospital was used as the operating room for the base spital. It has white tiling on the floor and on the wall to the height of 5 feet. The om contains two windows on the north and a skylight. It is splendidly lighted at ght and on dark days by a Noshado light.

The department laboratory occupies the first floor and basement of the isolation ilding in this hospital group. This laboratory does the work for this hospital.

The X-ray machine used is a Wappler 4-kilowatt, 220 alternating current, Coolidge quipment. The results have been uniformly excellent.

The post hospital is of light brick construction, heated by a hot-water system.

The temporary wards are constructed of pine, 100 feet long by 20 feet wide with an foot porch surrounding entire ward. The roof is tarred paper. The dining room d kitchen are constructed and covered by the same material. The floor in the itchen is of concrete. The entire temporary plant is heated by steam, which is rnished by a battery of six boilers. All buildings are lighted by electricity.

The post hospital contains the usual bathing facilities. A bathhouse with concrete oor, 12 shower baths, furnished with hot and cold water, is situated about the center the temporary wards and furnishes adequate bathing facilities.

The post hospital and temporary hospital buildings are connected with the post wer system. Excreta is disposed of in that way.

Garbage is collected in cans and carried away by the Quartermaster Department, and estroyed in the post crematory.

Fort Sam Houston is connected with the San Antonio water supply, which is abund- nt, comes from artesian wells, and is pure.

Aside from the commissary, the food supply is purchased from the San Antonio arkets. The quality is excellent and the quantity sufficient. The kitchen facilities this hospital are excellent and entirely adequate to handle at least a thousand atients.

The entire hospital is equipped with the Standard Medical Department equipment excellent quality and abundant in quantity.

The maximum number of medical officers on duty at this hospital during the year as 59 and the average 21.69.

The maximum number of enlisted men, Medical Department on duty was 235, and e average number 158.99.

The maximum number of members of the Army Nurse Corps on duty at this hos- ital was 58 and the average number 42.81.

When it became evident that this hospital would have to be enlarged, application as made for the assignment of members of the Army Nurse Corps to duty here. The rst nurses arrived June 30. Fortunately, it was possible to rent the Cunningham roperty for a nurses home. This building will accommodate about 20 nurses. Plans ere immediately made to build additional shelter for the nurses, and by August 15 ccommodations were ready for 56 nurses. It was the intention at first to construct two buildings similar to the standard temporary ward divided into rooms with tl idea that two nurses should live in each room. These two buildings were constructe on the Cunningham property, and owing to the location of trees, it was necessary make very material changes in the design of the buildings. They are better built tha the wards, and the porch, which is 10 feet, is on the east side of the buildings onl Each building has the necessary bathroom and lavatory facilities, with hot and co water. The hot water is furnished by a Pittsburgh heater. The buildings are light by electricity and are heated by a gas stove in each room. Taking it all together, tl accommodations have proved extremely satisfactory. It is estimated that the tv buildings for the nurses cost $3,000 apiece. The total allotment made for this hospit since June, 1916, is $56,828.90. This statement explains why only $50,828.90 w reported for the construction of the temporary hospital.

THE PUNITIVE EXPEDITION INTO MEXICO.

The mean strength of all troops, including officers, on the expedion into northern Mexico was 9,659, or when averaged for the ntire year, 8,343, on which is based the calculation for this report.

The following figures cover the period from March, 1916 (the eginning of the expedition) to the end of the year.

The admission rate for all causes was 810.26, that for disease being 88 and that for external causes 122.26. The diseases causing the ighest admission rates were: Diarrhea and enteritis, 193.10; veneeal diseases, 64.60; diseases of the pharynx, 51.66; malarial fevers, 9.96; undetermined fevers, 24.81; and diseases of the teeth and ums, 23.73.

The noneffective rate was 15.41 for all causes; that for disease eing 12.79 and for external causes, 2.62. The two diseases causing he highest noneffective rate were diarrhea and enteritis, 2.21, and enereal diseases, 2.14, respectively.

The rate for discharge on certificate of disability was 18.89; that or disease being 15.16, and for external causes, 3.73.

The death rate for all causes was 7.79 per 1,000; that for disease eing 2.28, and for external causes, 5.51. In all there were 65 deaths, 6 of which were attributable to external causes.

PUNITIVE EXPEDITION, MEXICO—SPECIAL DISEASES.

Diarrhea and dysentery.—The epidemic which started at El Valle he first part of July gradually subsided under the sanitary measures dopted, so that on August 1 there were 9.5 per thousand present oneffective. During August this further decreased so that on ugust 31 there were 4 per thousand present noneffective.

At Dublan the average for the month was 3.1 per 1,000 present oneffective.

For the whole division the average for the month was 4.5 per 1,000 resent noneffective.

Measures taken to prevent these diseases in addition to those lready in use are embodied in an approved sanitary recommendaion of the division surgeon and a sanitary memorandum of the anitary inspector, as follows:

> In view of the cases of infectious disease occurring in this division, it is hereby ecommended that the following order be issued for the division:
>
> No persons will be allowed to work about or open stores in the camps of this proision division until they have been examined by a medical officer, have received yphoid prophylaxis, been vaccinated and examined for vermin. They will be egularly inspected by a medical officer.
>
> No foods except articles in original packages or drinks except those in original ottles from the United States, or fruits except those having a rind will be sold.
>
> In view of the fact that infectious disease of intestinal type has occurred in camp ertain sanitary precautions are again recommended:
>
> All cooks and assistants should be of cleanly personal habits, always washing their ands before handling or serving food. Any cook or assistant with intestinal trouble hould be relieved promptly till he has recovered.

Each man should wash his hands before eating and should carefully scald his plat cup, knife, fork, and spoon before eating. This scalding should be thorough, an the water for the purpose should be kept on the fire and boiling until the last ma has had an opportunity to use it.

Nothing should be eaten or drunk outside of the company mess except package c canned goods which have been carefully packed by the manufacturer, and are sti packed when bought. Fruits with a rind are permissible.

No raw vegetables or milk should be eaten.

As the infection in this type of disease is always taken through the mouth the nece sity for the above precautions would seem clear.

The regimental medical officers will keep a strict supervision of the men of the command to detect the presence of any cases of fever, diarrhea or dysentery. Th cases of fever and dysentery should be sent to the hospital for isolation.

Venereal diseases.—Dublan showed the largest figures being, average present noneffective for the month 3.5 per 1,000.

Early in the establishment of the camp at Dublan prostitute began to practice their trade in the outskirts of the camp. Earl in July they were rounded up, segregated, and put under observation. It is believed that these measures combined with the measure of prophylaxis as provided for in General Orders No. 17, 1912, kep these diseases at this comparatively low figure.

Fevers.—There were 51 cases of fever at Dublan during the month Six proved to be paratyphoid (3 of which were diagnosed by laboratory findings); 11 proved to be malaria (determined by microscopica findings); 2 proved to be tonsilitis; 1 proved to be bronchitis; proved to be dermatitis of the nose, type undetermined; 29 wer fevers of a few days' duration, probably due to digestive disturbance as no other cause could be found.

About the 11th of August the Thirteenth Cavalry at Las Galera on the Santa Maria River began to develop malarial fever. Th command was at once put on quinine prophylaxis, isolation of th sick, and the use of mosquito bars.

The disease steadily increased up to the last of the month, whe it was 2.1 per 1,000. On August 29 the command arrived at Dubla and as there are no mosquitoes at Dublan it is believed the infectio will rapidly subside under the above measures.

The intestinal diseases have diminished very much under th measures of cleanliness of cooks, kitchens, and the sterilization c mess kits immediately before eating. For some time past all wate for drinking purposes has been boiled, as analysis showed the wate to be impure in many cases.

There were no prevailing diseases, but several cases of malari developed. Prophylactic doses of quinine were given to the entir command twice a week and there was no epidemic of malaria. Th number of mosquitoes and flies was greatly reduced owing to the col weather. A few mild cases which were clinically diagnosed dysenter were noted but were promptly cleared up after a few doses of emeti and salines. Only once was there more than one case under treatment at the same time. Dietetic errors caused some cases of gastriti and gastroenteritis. The malaria in the Thirteenth Cavalry ha practically stopped under the measures of isolation of the sick an cinchonization of the command.

Paratyphoid fever has been checked in the Eleventh Cavalry, except in September 17 cases came down with the disease. This wa thoroughly investigated but nothing definite could be found to account for the infection. It was thought that some hamburger stea ten on September 11 was the probable cause of the infection: but e feces of the cook and kitchen police proved negative for para- phoid, and on questioning the sick men more closely the majority them said they felt bad a few days before they ate the hamburger eak. A more scrupulous cleanliness of the kitchen and kitchen ensils was insisted on and carried out; further, water was boiled for inking purposes. These cases in the Eleventh Cavalry have since adually decreased. A few cases of this disease occurred in the hirteenth Cavalry, and the Seventh Cavalry still continued to have ses.

Provisions were made to vaccinate the whole command with anti- aratyphoid vaccine. The Seventh, Eleventh, and Thirteenth Cav- ry and Fourth Field Artillery were given their first dose September and 30.

The following recommendations were made to the commanding ficer at Camp Dublan:

> Many of the latrines have been found without the piece of tin on the inside of the x to deflect the urine to the center of the pit. This should be corrected at once herever needed.
>
> The day picket lines on the river bank are not sufficiently policed. This manure ould be hauled away at least twice a week to the dump northwest of camp, there be burned.
>
> There is still some diarrhea in the camp and it is believed the following additional nitary precautions should be adopted in view of the fact that in all probabilities is diarrhea, while mild in type, is of an infectious character and transmitted by rriers and by contact:
>
> 1. The cooks should be required to keep their persons scrupulously clean, likewise e kitchen police, and this feature should be supervised by the company com- ander and the surgeon.
> 2. No cook should be permitted to cook or handle food if suffering with diarrhea.
> 3. Kitchen police should be permanent.
> 4. Each man, immediately before eating, should be required to dip his meat can, p, knife, fork, and spoon in boiling water.

The division surgeon, punitive expedition, United States Army reports as follows:

Medical Department organizations and general equipment.—The regiments are equipped with a regimental infirmary, one ambulance, and the regimental and comba equipment.

While there has been no service on the divisional battle line, there has been som diversity of experience, extensive maneuvers, and camps of the equivalent of one an two brigades, and smaller ones, representing the waiting periods of war.

It has seemed very apparent that the reduction of the medical equipment of regiment to the combat equipment alone does not give sufficient for its service, an that it should not be less than a hospital infirmary tent, with sufficient supplies f the daily sick calls, an ambulance, and that the combat equipment should be hel packed for use in action. The use of a camp infirmary by more than one regiment i impracticable.

In the maneuvers the need of digging tools, folding litters, and of larger amount of ordinarily used supplies in divisible units or bandoliers for carrying forward to th lines, or for squadrons or troops separating from regiments, instead of the heavy chest now in use was noted.

It is the general opinion that it would be better to adopt a light standard aparejo a used by the machine gun companies of the Artillery which would be more easil obtained or repaired or replaced than is the Medical Department pack saddle.

Field hospitals and ambulance companies.—There are with the division two fiel hospitals, operating with extra equipment, as camp hospitals, but able to move a once. One hospital has motor transportation and one animal transportation.

The two ambulance companies have been organized as motor ambulance companie and their animal ambulances and extra personnel have been organized as provisiona companies so that there are now two motor and two animal companies.

The motor companies have been used only for evacuation work. There has been n service behind the battle line, and discussion as to the possibilities of motor transportation under all conditions is partly speculative. There have been certain condition however, of water, mud, and sand when the motor transportation could not perfor the service of mule-drawn transportation, and while these weaknesses of the moto may be to some extent overcome in the future, it is the conservative opinion here tha 50 per cent of the Medical Department transportation for the interior work of a divisio must be kept, at present, as animal-drawn transportation. The evacuation ambulanc companies should be motor companies.

The types of motor ambulances now in use are very satisfactory, and the motor ambulance companies have been very efficient and effective organizations. The Medica Department is handicapped, however, by being compelled to go to another departmen for the accessory motor vehicles which experience shows are necessary. It shoul furnish all the transportation needed without regard to its character.

Personnel.—The Medical Department of the expedition has been more liberall supplied with Regular medical officers than could be expected, but it has been diff cult at times to meet all conditions. Many changes have occurred and of the medica officers who entered Mexico with the expedition only 54.2 per cent now remain. Th number of medical officers in the field has varied from 3.5 to 4.5 per cent. The highes number including the receiving hospital, Columbus, N. Mex., has been 5.5 per cen Seven-tenths of 1 per cent is the least possible number with which the necessary dutie can properly be performed, and this percentage does not give sufficient margin f sanitary work, emergencies and casualties.

The numbers given in the Tables of Organization are barely sufficient, with n allowances for disability and the many additional duties arising. There should be i addition a reserve under the division surgeon for immediate use in emergencies.

The allowances of enlisted personnel with field hospitals and ambulance companie should also be liberal enough to give a reserve for replacing casualties and for pe forming the many sanitary duties which can not be specifically stated in table without reducing too much the working force of those organizations.

Rations.—Owing to the long line of communications the troops were kept longer o the reserve and field rations than has before occurred in the service.

There has been a general feeling that the reserve ration should contain some add tional article, and the individual longing is for something sweet. Sirup, additiona sugar, and rice have been frequently mentioned.

It is probable that an allowance of dried highly saccharinated fruit, in small package would be a welcome and wholesome addition to the reserve ration, and would enabl men to eat more of the hard bread and tolerate the ration longer.

Beans, both white beans and frijoles, were found to give digestive troubles durin the period when the time and facilities for careful cooking were not available.

Notwithstanding the absence of means for keeping food, very little food poisoning curred.

Equipment of troops.—In the general equipment of troops there is need of a water gon with filtering attachment and some changes in the rolling kitchens, which are t yet developed to do the kind of cooking desired by American troops.

An improvement should be made in winter clothing for the men for periods when e olive-drab shirt is too light and the olive-drab coat too tight and unsuitable. A cided want is some better and warmer night cover for cold weather, such as a light nket sleeping bag.

Sanitary methods.—The camp sanitary methods have been those now in general e, modified as necessary by improvised appliances.

Manure and wastes have been burned at the dump, garbage at the kitchens. For rines, trenches or open pits were used at first; later, boxes improvised from packing xes of various kinds, a few with only lid covers on pits. Later, oil and hay were ed for burning, and still later the method of oil and bone black was used at Camp ublan.

Water purification.—The Lyster bags, with hypochlorite of lime, were given sufficient st to determine the great usefulness of this method. It is stated that the continued e of water thus purified is unpleasant. This defect is partly due to defective ndling, insufficient number of bags, and using too much powder. An effort to tain a satisfactory neutralizing powder is also recommended.

The Darnall filters were also used by some organizations and gave universal satis- ction, as the water is clarified in the purification and has no unpleasant taste. uring a large part of the camp period the water was boiled for drinking, the other pliances being held for active service.

Personal cleanliness, laundries.—A great deficiency, especially for troops operating ay from sources of supply, is the means for personal cleanliness and for laundering, d the importance of these matters as sanitary measures can not be too greatly timated.

Summer shower baths have been made by all troops according to models as shown prints. Facilities for hand cleanliness and for winter bathing have not been as sily supplied.

Troops can not successfully do their own laundry work for months with cold water, d can not be kept in health when they can not wash and have their clothing laun- red in a proper manner.

The establishment of a laundry, where clothing is boiled and ironed, has been found eliminate lice and several elements of contact infection during the existence of epi- emic diseases and to render the use of more expensive and less effective modes of sinfection unnecessary, besides having a good effect on the morale of the command.

Everything must of course give way to active operations, but in the periods of rest should be the especial function of some department to attend to these matters, pply all necessary means for sanitation, personal cleanliness, and laundry, and this thout requisitions and without effort on the part of the troops, and to take over y necessary equipment on movement.

The necessary equipment could be supplied promptly and operated at very much ss trouble, labor, and expense and more efficiency than the makeshift methods hich have to be slowly developed each time.

Regulations for carrying out sanitary matters.—The principles of sanitation are tremly simple. The amount of labor, wear, and tear of inspection by many indi- duals in carrying out these principles in the Army are entirely out of proportion d are not creditable as a matter of efficiency.

Approved methods of disposal of wastes, treatment of water, and cleanliness, with l necessary diagrams and regulations, should be published for all conditions of mili- ry service, travel on trains, in camps in inhabited country and in wild country, the march, in one-night camps and in longer camps, and the responsibility placed ithout question for supplying the means and for carrying out these regulations. he burden at present rests too much on the inspectors.

Base hospitals, medical supply depot, and laboratory.—The cantonment receiving d forwarding hospital at the base, Columbus, has beeen an extremly active and portant part of the expedition; has cared for sick and wounded, furnished supplies d conducted a great variety of helpful functions, and has done this with a minimum penditure for construction and equipment.

Medical supplies have been plentiful and of good quality. The medical supply epot at El Paso has met all demands; has obtained and shipped supplies of all kinds ith remarkable speed, facility, and accommodation, and could not have done better.

Department Laboratory No. 2, at El Paso, has made the blood cultures and exami- ations of all kinds, including water examinations, and has given telegraphic reports

which have enabled the carrying out of sanitary measures with promptness an
confidence, and have gone far beyond the usual field of a laboratory in giving assistanc

Veterinary surgeons.—Reports and recommendations of veterinary surgeons a
inclosed.

Although their exact working status is not yet clear, they have been used for catt
and slaughtering inspection, and effort has been made to increase their connectic
with sanitary matters.

It is recommended that the younger veterinary surgeons be given a course at tl
Army Medical School, followed by a practical course at a post like Fort Riley, an
that their Supply Table and Regulations be given an early revision.

Typhoid prophylaxis, paratyphoid vaccination, and smallpox vaccination.—Son
revision of the present ineffective method of recording and checking the dates of tl
prophylaxis and vaccinations is needed. It was found that a large number of office
and enlisted men had gone over the required period and some had never receive
the typhoid prophylaxis. A large number of the men who volunteered in 1911 we
not given the prophylaxis on their reenlistment, as the period was too short, and we
later overlooked. Many were missed in changes of station and often by the surgeo
expecting the company commanders to notify them of data on descriptive lists.

Very few civilians on duty with the expedition had received the typhoid proph
laxis.

It is recommended that a new system placing the responsibility entirely on tl
surgeon be adopted. It has been suggested that a medical descriptive list be ke
in which all data concerning prophylaxis, vaccinations, and venereal, malarial, ar
other medical history of interest to a medical officer be kept and follow the soldie

Civilians should not be employed for service with the Army until examined, vacc
nated, given the prophylaxis, and registered on a descriptive list as are soldiers, ar
should undergo the same bimonthly and other physical examinations.

Reservists should not be allowed to join without examination, renewal of proph
laxis, and vaccination. Quite a number have joined from their homes with venere
diseases and have been admitted at once to hospitals.

Health of the command.—The admission rate for the period from March 15, 1916,
February 5, 1917, was 585, the constantly noneffective, 25.05, and the death rate, 4.7
The same rates for the Army in 1915 were 726.19, 25.22, and 4.45.

In the early part of the expedition when commands were moving the sick rat
were low; later, as they remained longer in partly settled camps, sickness increase
then, as troops became more permanently established, and with more thorough metho
of sanitation, the sick reports were reduced, the rates at all times being in proportic
to the size of camps, the highest rates and the greatest variety of disease occurring
the largest camps with the greatest civilian contact.

The diseases given the highest admission rates were intestinal diseases, giving a ra
of 247.34 per 1,000; fevers, 46.16; venereal, 43.58; tonsillitis, 40.67; respiratory, 24.3
The venereal were mostly old relapsing cases.

Diarrheas, bacillary, and amebic dysenteries, paratyphoid and typhoid fevers a
common diseases in northern Mexico. The exact classification of the intestinal di
eases, of course, is inexact in the field. Amebic dysentery is common, but not
severe and intractable as in the Philippine Islands.

Ninety-three cases of paratyphoid fever were reported by blood cultures, b
during the prevalence of the disease there were two or three times as many cases
mild fevers of undetermined origin, undoubtedly due to the same infection. Sev
cases of typhoid were reported by laboratory examination of blood cultures. O
had never had the prophylaxis and the others varied from five and one-half years
two and one-half years. It is of interest that these cases occurred in a group of wh
was apparently a pure paratyphoid epidemic and did not differ clinically. The vac
nation of the command ended the paratyphoid fever.

During the prevalence of the above diseases the command was exposed to vario
elements of infection, innumerable flies, polluted water, and contact infection, a
there has been some difference of opinion as to the modes of infection. Flies, whi
were innumerable, were the probable carriers of the paratyphoid fever. A ve
marked reduction of intestinal diseases followed the use of boiled water by co
mands which had been using water untreated.

Malarial fever was almost confined to one regiment, which was for military reaso
camped for some time in a wet region. No cases of typhus fever occurred, and the
was no mortality from any fever.

Causes of transfer to base hospitals.—Venereal diseases constituted the conditi
requiring the largest number of transfers to the United States, syphilis giving t
greatest number of any disease.

ı the first weeks of the expedition gonorrheal cases were the principal causes of
ısfer, but in the succeeding six months syphilis gave each month the highest rate
disease requiring transfer, and it was unquestionably shown that men with this
ase will not stand the hardship of field service. Indeed, their treatment and care
been so troublesome and so expensive that it is very doubtful if it is economical
eep them in the service. All but one of the cases of syphilis were old cases,
y one occurring in Mexico, and many of the gonorrheal cases were relapses of old
s.

eaths.—There were 57 deaths, 20 or 1.67 per 1,000 from disease and 37 or 3.08 per
0 from injury, or a ratio of 1 death from disease to 1.85 from injury.

vacuation of patients on withdrawal of troops.—During the withdrawal of the com-
ıd from Mexico 320 men were transported to the base hospital, Columbus, N. Mex.
this number 175 were transported by ambulances, 39 recumbent and 136 sitting.
145 by truck trains, 89 as guards and 56 as passengers, this number including
ıy slight cases.

ll cases were transported comfortably and without suffering or mortality.

pecial features of the expedition.—The command entered Mexico with equipment
" before the cold weather was over, operated actively in a difficult desert country
a long line of communications with light clothing, shelter, and food supply.
cers and men were on a restricted ration for a longer period than known in our
ıy.

fter the active period, without materially increased means, clean, well-kept,
erly camps were established. Adobe was used for shelter, sanitary appliances,
cooking. Starting with separate appliances and fires for open cooking, ovens,
ling water, and incinerators an economical combined adobe range with one fire
developed for these purposes.

he punitive expedition lived nearer the earth and learned to get along with less
n any command in our experience. It has been hardened by active service and
y profitably interested and occupied in professional work and training; has been
erful, and has maintained the good health and sanitation that go with good dis-
ine. The country has never had a more thoroughly trained and fit command than
one which marched back to the border

ith the direct effective methods and the cordial backing of the division commander
task of handling the different epidemic diseases and sanitary matters in the
edition has been an easy and pleasant one.

CULAR 12.

Office Division Surgeon,
Provisional Division,
Dublan, Mexico, September 8, 1916.

edical officers on duty with the Provisional Division, punitive expedition, will
e report on the operation of the Medical Department coming within their exper-
e during the expedition. Junior medical officers serving as assistants will not be
ired to make report but are invited to make such report and recommendations
hey may desire.

t is particularly desired that the work of all medical officers and enlisted personnel
he Medical Department be made of record, and that any improvements of the
tary service developed during the expedition be reported.

he following items are suggested for report as well as any personal experience and
ters of interest to the Medical Department and to the history of the expedition.

The organization of the Medical Department of the expedition.

Marches and camps.—Any especially arduous marches of interest with report
ffect on the command, and the working of the Medical Department units.

Medical Department personnel with recommendation for any changes.

The equipment of the Medical Department with any recommendations as to
nges or superfluous or deficient equipment.

Transportation.—The amount needed for organizations on the march, in camps.
evacuation of the sick and wounded. Questions of mule and motor transporta-
and their fields of usefulness on and off roads, etc.; experience in transportation
ick and wounded; desirability of the Medical Department owning and supplying
wn transportation.

Rations and diet.—Modifications which should be made in the reserve ration;
th of time it can be used without evil results; the first articles which should be
ed to make field rations; cooking equipment for different Medical Department
ts.

Observation on methods of water purification and use of purified and unpurified
er by the command.

8. *Camp sanitation.*—Recommendations as to the absolutely essential measures f moving command, in camps of a few days, and in more permanent camps which shou be formulated in orders to the Army, and which should include the departments supply. Is the burden of carrying out common well-known sanitary measur accepted by the proper officers?

8½. Any changes in Medical Department reports, returns, or forms.

9. The nature of the diseases encountered; diseases due to food, water, conta infection, flies, dust, climate; discuss the camp diarrheas or dysenteries; comparati sickness in moving commands and in camps.

10. The general physical condition of the command at the close of the expeditio

11. Officers are requested to make up their report at once and to complete and su mit immediately on the order for the return of the expedition to the United State

PUNITIVE EXPEDITION, UNITED STATES ARMY.

Under date of March 30, 1916, the division surgeon states that at the first moveme of troops across the border at Columbus, he was directed by the chief of staff to pr ceed with the troops and investigate the water supply at the proposed camp site Las Palomas.

Camp was made after a march of about 7 miles, and the division staff establishe This troop movement consisted of the Thirteenth Cavalry, Sixth Infantry, and Si teenth Infantry with regimental sanitary personnel. The Seventh Field Hospit Company and Ambulance Company No. 7 remained with other troops at Columbu During the three days in this camp, there was opportunity to return to Columbus a have medical officers assigned, etc.

About 12 hours after the troop movement from Columbus, the Seventh and Ten Cavalry and two batteries of Sixth Field Artillery crossed the line near Culberso Ranch, N. Mex., under the personal direction of the division commander. Th column had sanitary personnel and a small amount of supplies; they marched ov 100 miles in two days.

When this camp was reached by this western column, the ambulances, most of t supplies, and two medical officers were left here with the Artillery and detachmen and the regiments of Cavalry proceeded southward at a rapid rate.

The Cavalry and Infantry regiments and headquarters left Palomas on March 1 17, and 18. The march extended 26 miles over a steep, rocky, dusty road. The was no water en route. Camp was established at Boca Grande, where the water fro Casas Grande River was fairly good.

The Seventh Ambulance Company joined at La Espia, the next camp, havi marched south by way of Gibsons Ranch. The Seventh Field Hospital joined Ojo Frederico, having marched by way of Gibsons Ranch with the field trains of t Seventh and Tenth Cavalry; first march 35 miles, second march 17 miles, and thi march 26 miles.

At Ojo Frederico the division surgeon, in addition to other duties, resumed co mand of Field Hospital No. 7. One mule from the field hospital train was dead, a one was exhausted and has not been able to work since the second day. From t point the Field Hospital and Ambulance Corps accompanied the main body. T Field Hospital Company marching on foot was so thoroughly exhausted by a 25-mi march against the wind on the day of reaching here, that had it been necessary care for the sick or wounded, a great hardship would have resulted to both the p sonnel of this company and to the patients. Camp was made in a raging dust sto which lasted over 24 hours. For two nights after the wind subsided ice formed the division surgeon's tent.

In order to carry the requisite amount of rations and forage and not overload t train, considerable of the field hospital equipment was left in Columbus, but 1 patients could now be cared for.

On account of the scattered condition of this command and the fact that ea regiment is supplied with far more equipment than is contemplated in the Tables Organization, there has been little division surgeon work to do.

About the middle of March the division surgeon was able to forward medical offic Hospital Corps, men and supplies to the Seventh, Tenth, and Thirteenth Caval Regiments. Maj. Eastman was the senior to go forward.

SANITATION.

The water supply here and at other camps has been and is open to suspicion reason of the probability of pollution, not poisoning. Many organizations came i the field without the bag, water, sterilizing, and practically none had the hypochlor powder and the bag both; for the reason consult General Orders 39, 1915.

he division commander asked for a 30-day supply of powder and enough bags to ply each organization.

o diseases have arisen which could be charged to climatic conditions or local ections. Regimental surgeons have been directed to talk lice dangers and pre- tion in their regiments and to have inspections.

ttention is called to the unfortunate shortage of ranking medical officers at the ler stations of the Seventh, Tenth, and Thirteenth Cavalry Regiments, which ilted in two of these regiments taking the field with Medical Reserve Corps officers one with a junior captain as regimental surgeon. This has now been corrected, only after two weeks of the campaign have passed.

ssignment of medical officers to regiments, instead of to stations, and with due ırd for rank and experience would seem to be indicated.

TRANSPORTATION.

he surgeon medical base group says that a motor ambulance company is promised, ch improves the situation in regard to transfer of patients. So far this has been e on motor trucks, irregularly and with some harsdhip to patients. There have n no serious cases to transfer.

fter careful observation, the division surgeon is of the opinion that the personnel eld hospitals and ambulance companies should be provided with transportation. marches are necessarily long, on account of the scarcity of water and exhaustion; these companies are not capable of giving the proper care to the sick and wounded r the fatigue of a march of between 20 and 30 miles.

he line of communications is over 200 miles long, and there is but one ambulance pany and field hospital now located near its mid point. The location seems cal, but just what would be done with say 200 or more wounded a hundred miles he south during the four days the field hospital and ambulance company were ching to their assistance, remains problematical. The solution seems to be to orize the Seventh Ambulance Company and the Seventh Field Hospital as nptly as possible.

he regiments each have mule-drawn ambulances so that sick or injured on inac- ible roads could be brought in. To motorize the field hospital would require ree-ton trucks in order to carry the equipment and personnel and 1 seven-pas- ger touring car for officers preferably Cadillac. The four-wheel drive steer and e Jeffry Quad seems to be giving excellent service though it makes small gasoline age.

rucks should be purchased by the Medical Department, as ambulances, and could "temporarily" used to transport the field hospital.

s witness by the difficulties of the Seventh Field Hospital with transportation, at Sam Houston, inexperienced quartermaster drivers, who had to be replaced by pital Corps men on the march, etc., so long as the Quartermaster Corps provides sportation for Medical Department units confusion, conflict, and inefficiency result.

UNITED STATES MILITARY ACADEMY, WEST POINT, N. Y.

he surgeon at the United States Military Academy renders the owing interesting report on the health and sanitary conditions hat institution:

rps of cadets.—The health of the corps has been excellent throughout the year. re were 663 hospital admissions during the year, equivalent to an annual admission of 992.5 per thousand. As this is the first sanitary report from this station cover- a calendar year, no admission statistics are available for comparison. The last rt, however, for the fiscal year ending June 30, 1916, showed an annual admission of exactly 1,000 per thousand, as compared with 1,127 per thousand for the year eding. This is the smallest admission rate recorded in the past 10 years.

e noneffective rate for cadets in hospital was 14.19 per thousand for the calendar 1916. For the fiscal year ending June 30, 1916, the rate was 13.82 per thousand, ompared with 19.83 for 1915; this is the smallest rate during the past 10 years, pt in 1914, when it was 11.92.

ith one exception there were no cases of critical illness or of serious injury under ment during the year; one cadet developed pulmonary tuberculosis and was trans- ed for treatment to Fort Bayard, N. Mex., where he has since died.

mild but very contagious epidemic of influenza occurred early in the year, lasting t one month and affecting some 16 per cent of the corps. One hundred and eight cases were admitted to the hospital for treatment, the average duration of each c being about four days; there were no serious complications. There were four adm sions for malaria during the year, two new cases and two recurrences from previ infections. Nine cadets were discharged for physical disability as follows:

Valvular disease of heart..
Venereal disease..
Defective vision..
Chronic atrophic rhinitis..
Chronic otitis media..

Two cadets were transferred to the Walter Reed General Hospital, Washingt D. C., with dementia precox. Two cadets died during the year, both being on lea of absence.

Of the 663 hospital admissions, 152, or 22.92 per cent, were for diseases of the dig tive system, including gastritis and gastroenteritis, diarrhea and intestinal colic and constipation 52; general diseases furnished the next largest number, 135, or 20 per cent, including 108 cases of influenza; injuries and other affections due to exter causes furnished 131, or 19.75 per cent; diseases of the respiratory system 86, or 12 per cent; diseases of the eye and ear, including 39 cases of conjunctivitis, 67, or 10 per cent. Of the 131 affections due to external causes, 22 were football injuri 20 due to accidents during riding, 19 to gymnastic exercises, 12 to badly fitting sh 9 to baseball, and 3 to basketball.

Football.—During the football season, from September 1 to December 1, there w only 22 accidents requiring hospital treatment. This is the smallest casualty during the past 10 years and is the direct result of careful supervision of the foot squad on the part of the medical officer in charge and of the coaching staff dur practice and in contests with other teams.

The following table shows the number of football injuries during the past 10 y and the number of days lost by treatment in hospital:

Year.	Number of cases.	Days lost in hospital.	Aver days cas
1907	25	117	
1908	62	362	
1909	34	174	
1910	27	210	
1911	34	169	
1912	35	259	
1913	28	157	
1914	36	221	
1915	25	159	
1916	22	106	

Enlisted men.—There were 255 admissions to sick report during the year in a c mand numbering 719 men, equivalent to rate of 335 per thousand. The noneffect rate was 7.46 per thousand. As a basis for comparison the following table is submit showing corresponding rates for fiscal years since 1911:

	1911	1912	1913	1914	1915	1
Admissions to sick report	622	401	415	302	359	
Rates per thousand (admission)	825	626	603	468	501	
Noneffective rates	18.87	14.81	15.26	11.25	9.35	
Mean annual strength of command	649	648	688	702	716	

The admissions for transmissible diseases included venereal 24 (10 were read sions); influenza 29; malaria 3 (2 were readmissions); tuberculosis 1; and cerebrosp meningitis 1.

The general sanitary conditions were excellent throughout the year. Mosq breeding was kept at a minimum by oiling stagnant water in places where drai was impracticable and in cutting grass and foliage in the neighborhood of habitati Fly breeding was controlled by prompt removal of manure and by treating st floors with a solution of hellebore in a strength one-half pound to 10 gallons.

Poliomyelitis.—Late in May poliomyelitis in epidemic form appeared in Brook having its apparent origin in the water-front section of that city. It spread t rough of Manhattan during the month of June, and by the first week in July more n 100 cases daily were being reported from New York City. The epidemic reached height in Brooklyn on July 11, when 151 new cases were reported, and in Greater New York on August 3, with 217 new cases. From this time the disease steadily lined in that city, the daily number of new cases falling permanently below 100 August 25, below 50 on September 10, and below 10 on October 15, reaching the mal average of from 2 to 5 per week during the latter half of December.

Originating as it did in the early summer months, at a time when many residents he city were about to leave for their annual outing, the disease spread from New k City along the main highways of travel to Long Island and to districts along the dson River, then to the central part of the State and later to counties in the north- tern section, south and east of Lake Ontario. The most heavily infected counties e, in the order mentioned, those of Long Island, those bordering the southern two- rds of the Hudson River, and the two central counties containing the cities of acuse and Utica. By the middle of July the number of new cases reported from State (outside New York City) exceeded 25 daily, and on August 1 the number eeded 50, the maximum being reached on August 22, when 142 cases were re- ted. From this date there was a decline in the epidemic until the first week in tober, when the number of new cases daily fell below 20, reaching the normal level ut the middle of November.

On account of the appearance of poliomyelitis during the first week of July in towns ng the Hudson River, both above and below West Point, and because of the evident ger of introducing the disease into the garrison by means of visitors and tourists iving from infected districts, a memorandum was issued on July 8 by the super- endent, on the recommendation of the surgeon, Capt. H. C. Coburn, Medical Corps, bidding children under 16 years of age from passing back and forth on the reser- ion, and requiring all persons residing or employed on the reservation to notify surgeon at once of any suspicious case of illness.

The first recognized case of poliomyelitis in Highland Falls was reported by the al health officer on July 29 in a child 18 months old in an Italian family living near center of the town; the child died on the following day. The origin of this case ncertain, but there was a history that the family had been visited by friends from w York City two weeks before.

The second case, also fatal, was reported on July 30, and occurred at the extreme thern end of the town, some 4 or 5 miles distant. In this case the parents stated t the child had been brought from Jersey City about three weeks previously.

The third case occurred about this time in a child of 18 months belonging to a family ing in the country 4 miles northwest of the village of Highland Falls. There was istory that the family had been visited by two adults from Brooklyn about two eks previous to the onset. In these three cases there was an uncertain history of posure to infantile paralysis in a district known to be infected or of contact with ults who had come from such district, but there could have been no ætiological nection between any of them.

The occurrence in the village of Highland Falls of three cases of infantile paralysis, ctically simultaneously but at points widely separated, indicated multiple foci of ection at fairly close range and showed the necessity of taking greater precautions protect the garrison. A general order was accordingly issued on July 31 upon the ommendation of the surgeon, Capt. H. C. Coburn, jr., Medical Corps. The salient visions of this order were as follows:

The discontinuance of general pleasure travel to and from West Point; visitors to st Point, including persons arriving on business, to be admitted on permit only, er investigation to determine that they had not been residing in infected districts; enlisted men on duty at West Point to be restricted to the reservation; classified ilian employees to be allowed to come and go on permit; certain other civilian ployees to be furnished transportation to and from their work; others to be marched and from work under charge of a noncommissioned officer; servants not to be allowed leave the reservation; the vending of all food products, vegetables, fruit, meat, ., to be prohibited.

By the middle of August all towns in the immediate vicinity of West Point became ected, and as the number of cases reported from these towns showed a steady rease it was thought advisable to still further restrict travel to and from West int and to reduce to a minimum all outside communication. Accordingly upon ommendation a memorandum was issued on August 14 providing that "all re- ests for permits to enter the reservation for any purpose, except necessary pleasure rposes, be withdrawn."

From the latter part of July no further cases were reported in Highland Falls until gust 19 when I was called in consultation by one of the doctors in that village to see a suspicious case in a boy of four years. There were no definite physical sig of infantile paralysis, but on the following day a spinal puncture was performed whic showed a perfectly clear fluid with a cell count of about 200 per cubic millimet and a double plus Fehling's reaction. A positive diagnosis was at once made and t case reported to the Surgeon General as poliomyelitis. It may be added that a expert diagnostician from the New York State board of health examined the case few days later and agreed with the diagnosis. A transitory paralysis of the extern rectus of the right eye subsequently appeared, lasting about two weeks. This ca occurred in the family of a civilian living about 100 yards from the house in whic the first case was reported. As a period of about three weeks elapsed between the two cases and as the incubation stage of the disease is believed to be less than tw weeks, it is probable either that some "missed case" occurred in the interval or th the second case was contracted from a carrier who had come into contact with t first or with some other case.

Following this case there were 10 more during the month of August and 10 betwe the 1st and 15th of September, on which date the last case of this series was reporte On November 16 a child of 3½ years was reported with infantile paralysis living in family about 7 miles southwest of West Point. The infection was probably co tracted at Fort Montgomery, the next township south of Highland Falls. The chi was seen in consultation by one of the post medical officers and the diagnosis confirme This was the last case occurring in this vicinity so far as known. These 25 cases we about equally divided between the civil and military population of the town, t latter including the families of soldiers and civilian employees.

A large detail of officers was due to report for duty near the end of August and i order to minimize the danger of the introduction of poliomyelitis into the garris the adult members of their families were not permitted, for a period of two weeks, associate with children under 16 nor with cadets, except as required by official dutie children of these officers were placed in quarantine for two weeks. Upon their retu from furlough on August 28, the second class were placed in camp under guard a were kept from coming in contact with other members of the corps for a period of tw weeks. This quarantine, however, did not interfere in any way with academic wor During the continuance of the epidemic in Highland Falls no children under 16 yea living on the reservation were allowed to attend school, Sunday school, or church.

As soon as a case of infantile paralysis was reported in the family of any enlist man in Highland Falls, the soldier was directed to return to his family and to rema there for six weeks. Prior to his return to the garrison for duty his nose and thro were treated daily for three days with an antiseptic solution.

During the last two weeks in August there was a marked increase in the number cases of infantile paralysis reported in Highland Falls. Up to August 19 there ha been only three cases. From that date to August 31, 11 new cases were reported and o each on September 1 and September 2. On account of this rapid increase in cas it was decided to make a complete medical survey of the military population Highland Falls and to persuade, if possible, the local health officer to do the sam with respect to the civil population, with a view to determining whether or not a cases of the disease were being recognized and reported. Accordingly, with t consent of the superintendent, Capt. A. N. Tasker, Medical Corps, was placed charge of the survey work and was given a commissioned medical officer as an assis ant, Lieut. F. B. Hutton, Medical Reserve Corps. On September 7, with the acqu escence of Dr. Kurtz, local health officer, I had an interview at Albany with t deputy health commissioner, Dr. Linsly R. Williams, and explained to him t condition of affairs in Highland Falls, and asked for cooperation of the State board health in our efforts to make a general medical survey of the town. He very gene ously agreed to detail one of his "polio experts," who was then on survey work Long Island, Dr. J. W. Babcock, who reported for duty and began the work of exam nation on September 12.

Every effort was made to include in this examination all children in the villa under 18 years of age. To this end the medical officers were provided with offic lists of the names and addresses of the families of all the soldiers and civilian employe with the number of children in each, while the town authorities furnished Dr. Babco with the necessary information in regard to the children of the civilians. It is believ that not more than 2 or 3 per cent of children escaped examination. In regard to t scope of the physical examination, it was made with sufficient thoroughness to ru out the possibility of an existing poliomyelitis.

The work was completed in about three weeks and the results testify to the ca and thoroughness with which it was done. The report of Capt. Tasker (mention under special work of medical officers) includes an analysis of all the cases of infanti paralysis, both military and civil, with statistical information in regard to t medical survey.

On October 14, one month after the onset of the last case in Highland Falls, the arantine restrictions in regard to adults were removed, and on November 15 children re allowed free access to and from the reservation.

The freedom of this garrison from infantile paralysis was not entirely due to good ck, for every town in the vicinity of West Point was more or less infected from early July to October, including Fort Montgomery, Cornwall, Newburgh, Peekskill, rrison, Cold Spring, and Fishkill. Three controlling factors were, in my opinion, tive in excluding the disease from West Point: First, and most important, pro- biting children under 16 from passing back and forth off and on the reservation: is measure excluded the prime sources of infection; second, the restriction of travel and from West Point to persons having official business only, thus minimizing the nger from carriers; and third, the thorough medical survey of Highland Falls which de it possible to identify practically every case of infantile paralysis, and thus able us to take the necessary precautions against the spread of the disease.

The surgeon sums up his remarks on this subject by offering the llowing as the policy which should govern in the adoption of regu- tions for the protection of the garrison at West Point and by which ey were guided in their extensive investigation:

Poliomyelitis is a transmissible disease caused by a specific virus which is present the nose, mouth, and bowel discharges of patients suffering from the disease and so in the nose and throat of healthy associates of poliomyelitis cases, i. e., healthy rriers.

Poliomyelitis is exclusively a human disease, spread either by direct personal ntact or indirectly by means of contaminated food and drink.

The incubation period of the disease is usually less than two weeks, and probably the great majority of cases between three and eight days. Ordinarily the virus es not persist in the body longer than four or five weeks, except in those rare cases that come chronic carriers; hence cases of infantile paralysis which have been kept der supervision for a period of six weeks from the onset of symptoms may be regarded practically free from danger (Flexner).

Carriers are persons, either adults or children who have recovered from an acute tack of infantile paralysis or who have come into contact with the disease in its ute stages (Emerson). It is not believed that a person may become a carrier by ere association with another carrier. "The difficulty in controlling poliomyelitis s in the large number of healthy carriers who are the sources of infection in nearly l cases" (Regulations California State board of health).

"Missed cases" are probably exceedingly common on account of the prevalence ring an epidemic of abortive cases where no paralysis is present; such cases may tnumber those of frank paralysis.

Poliomyelitis is a disease of early childhood. Of 7,500 cases occurring in New ork City, 10 per cent were under 1 year, 85 per cent were under 6 years, and all but 7 per cent under 16 years.

ALASKA.

The mean strength of the troops, officers and enlisted men, servin in Alaska during the past year was 770, as compared with 787 i 1915. This force consisted of Infantry, Signal Corps, and Hospit Corps, all white. Alaska still remains the healthiest region in whic the Army is stationed.

The admission rate for all causes was 338.96 per 1,000 in 1916, compared with 378.65 in 1915. The rate for disease was 241. per 1,000, and that for external causes 97.40, as compared wit 292.24 and 86.40, respectively, in 1915. The corresponding rat for the United States were, for total causes 733.29 per 1,000; th for disease being 604.30, and that for external causes, 128.98. T diseases having the highest admission rates are shown in the fo lowing tabulation:

Admission rates for some of the principal diseases for Alaska. American troops, offic and enlisted men.

PHILIPPINE ISLANDS.

AMERICAN TROOPS (ENLISTED MEN.)

By reference to the figures furnished below it will be noted that a ght improvement in the health of the American troops serving in e Philippine Islands resulted during 1916 when compared with the ures for 1915. While the rate for venereal diseases (all) compared vorably with the admission rate for 1915, these diseases still remain matter of concern. The admission rate for malarial fever has taken slight drop compared with the rate prevailing for that disease ring 1915, being 63.12 for the latter and 62.95 per 1,000 for 1916.

The mean strength of the enlisted American troops stationed in e Philippine Islands for the year was 11,580 (S. G. O.). Of this mber 10,635 were white and 945 colored. The statistics for the ilippine Scouts, of whom there were 5,579, will be given separately.

ADMISSION RATES.

During the year there were 9,711 case admissions for all causes, ite and colored troops, making a case admission rate of 838.60 r 1,000, as compared with 117.21 case admissions and a case mission rate of 990.45 per 1,000 for 1915, 877.69 for 1914, and 2.06 for 1913.

The case admission rate for disese only was 714.42 for 1916, 1.05 for 1915, 746.61 for 1914, and 776.28 for 1913.

The case admission rate for white troops for all causes was 808.93 as compared with 1172.49 for colored troops, the later having a ean strength of 945 during the year.

The case admission rate for injuries for white troops was 105.88 r 1,000 as compared with 330.16 per 1,000 for colored troops, d for the total American troops, white and colored, 124.18 per 000, the lowest rate for several years.

CONSTANTLY NONEFFECTIVE RATES.

The total constantly noneffective rate for the year was 27.88 per 000: that for white troops being 26.87 and for the colored, 39.29.

The total noneffective rates for disease only in 1916 was 23.81 r 1,000, as compared with 23.33 for white troops and 29.27 for lored. The rates for 1915 were 25.42, 24.62, 31.73, per 1,000, spectively.

DISCHARGE ON CERTIFICATE OF DISABILITY.

The American soldiers are very rarely discharged in the Philippine lands, being invalided home and discharged in the United States; owever, those so discharged are credited to the Philippines. Table o. 28 shows the diseases for which these discharges were made.

The discharged rate for 1916 was 14.42 per 1,000 as compare with the corresponding rate of 23.22 for 1915. The rate for diseas was only 13.13 per 1,000, and that for injury. 1.30, as compare with the corresponding rates of 22.04 and 1.18 for 1915. The tot rates for the white troops was 15.23 as compared with 5.29 p 1,000 for the colored troops.

The disease causing the highest number of discharges were: Ment alienation, with a rate of 3.28; tuberculosis, 2.25; flat foot, 1.9 and venereal diseases, 1.21. The corresponding rates for the Unite States were 2.65, 1.94, 1.42, and 1.63 per 1,000, respectively.

DEATHS.

Deaths occurring in the United States in the persons of those inralided home from the Philippine Islands are credited to that station.

There were 52 deaths among the American troops, officers and enisted men, during the year 1916, all of which were enlisted, white nd colored: 32 from disease and 20 from injury, the total death ate being 4.48 per 1,000. The figures here given are taken from Table No. 29 and are for officers and enlisted men. The figures lightly differ from those given in Table No. 72 at the back of the eport, which are for enlisted men only. The total death rate, offiers and enlisted men, for 1915 was 2.87 per 1,000; that for disease eing 1.59 and for injury 1.29 per 1,000. There were 4 deaths from lrowning in 1916, as compared with 3 in 1915. There were 6 suicides n 1916, as against 6 in 1915.

Tuberculosis caused 11 deaths in 1916 and 6 in 1915; dysentery, 1 n 1916 and 2 in 1915; alcoholism, no deaths in 1916 and none in 1915.

PREVALENCE OF SPECIAL DISEASES, AMERICAN TROOP (ENLISTED MEN).

TYPHOID FEVER.

None occurred in 1916, or in 1915 and 1914.

MALARIAL FEVERS.

The admission rate for all fevers of this class was 62.95 per 1,00 as compared with 63.12 in 1915 and 45.26 in 1914. The rates f American and native troops are shown graphically in charts X and

By reference to Table No. 31 it will be seen that Camp Stotse burg had the highest admission rate for American garrisons, 178.5 per 1,000, as compared with 121.18 in 1915. Camp Eldridge la year stood in fourth place, this year has advanced to No. 3. Fo Mills, which was No. 2 on the list in 1915, now takes the same plac with a rate for 1916 of 58.85, compared with 88.48 per 1,000 in 191 In this connection it should be noted that the posts garrisoned wit native troops have considerably higher admission rates than thos garrisoned with American troops.

TABLE NO. 31.—*Malarial fevers, year 1916, compared with year 1915, for stations in t Philippine Islands.*

Posts.	Ratio per 1,000 of mea strength.	
	1916	1915
Principally of American troops:		
Camp Stotsenburg	178.54	121.
Fort Mills	58.85	88.
Camp Eldridge	29.89	32.
Fort William McKinley	28.32	17.
Camp McGrath	14.58	12.
Cuartel de Espana	8.85	10.
Regan Barracks	8.73	37.
Fort Santiago and headquarters of Philippine Department	8.06	27.
Principally of Philippine Scouts:		
Augur Barracks	87.70	57.
Camp Nichols	44.25	26.
Camp Overton	40.09	110.
Ludlow Barracks	36.48	213.
Pettit Barracks	31.58	62.
Warwick Barracks	27.84	21.
Camp John Hay	15.93	13.
Fort San Pedro	11.83	56.
Camp Keithley	10.44	43.

UNDETERMINED FEVERS.

The admission rate for these fevers during 1916 was 5.22 per 1,000, compared with 4.31 in 1915, 4.39 in 1914, and 5.27 in 1913. The ious diagnoses under this head are:

nission rates, Philippine Islands, American troops, and enlisted men, per 1,000 of ean strength, for undetermined fevers in 1916, compared with years 1913 to 1916, iclusive.

	1916	1915	1914	1913
ricula	71	27	24	9
ers, simple, continued, and type undetermined	22	63	44	50
Total[1]	93	90	[illegible]	59
io per 1,000 of mean strength	5.22	4.31	4.39	5.27

[1] Total for 1916 includes officers and natives.

The diagnoses given above are for officers and enlisted men, Ameri- troops, and Philippine Scouts.

SMALLPOX AND VARIOLOID.

No cases occurred in the islands.

VENEREAL DISEASES.

Notwithstanding vigorous efforts made by the authorities and the rying out of the provisions of G. O. 31, 1913, and G. O. 45, 1915, nereal diseases still hold first place for both admission and non- ective rates. Of the total admissions for the year over one-fifth re due to venereal diseases. There were 415 admissions for philis, 409 for chancroid, and 1,067 for gonorrhea. Of the total neffective rate for disease, 23.81 per 1,000 venereal diseases alone ntributed a rate of 7.77 during 1916 as compared with 8.10 in 1915. The following tabulation shows the admission rates and their uses for the enlisted personnel serving in the Philippines during 16:

Venereal diseases, Philippine Islands (enlisted men).

	Syphilis.	Chancroid.	Gonorrhea.	Total venereal.
ite troops:				
1916	36.48	35.64	83.78	155.90
1915	37.93	38.79	100.35	177.08
red troops:				
1916	28.57	31.75	186.24	246.56
1915	62.64	32.06	164.05	258.76
American troops (enlisted):				
1916	35.84	35.32	92.14	163.30
1915	40.73	38.02	107.57	186.32

TABLE No. 32.—*Venereal diseases among officers and enlisted men at posts in the Phili pines having strength of more than 300 men, year 1916.*

Posts.	Admissions.		
	Total.	Ratios.	Mean strengt
Principally American troops:

Camp Keithley	5	5. 80	
Camp Overton	2	4. 45	

CHOLERA.

Five cases of cholera reported among the American troops durin 1916.

TUBERCULOSIS.

Fifty-one cases of tuberculosis occurred among American troop making a ratio of 4.40 per 1,000. Forty-nine cases were transferr to the United States. Of the 11 deaths reported 9 occurred in t cases invalided home. In 1915 there were 76 cases of this diseas with an admission rate of 6.42 per 1,000, with 6 deaths.

BERIBERI.

No cases occurred among American troops.

DYSENTERY.

A marked increase in the incidence of this disease is noted for 191 but 139 cases occurring with an admission rate of 12 per 1,000, compared with 63 cases with a ratio of 5.32 in 1915. Of the 1 cases reported, 6 were bacillary, 123 entamoebic, and 10 cases u classified. The entamoebic dysentery gives an admission rate 10.62 per 1,000.

The noneffective rate for dysentery (all) was 0.79 per 1,000 f 1916, as compared with 0.31 for 1915.

DENGUE.

This disease, which appeared in epidemic form at seven posts in islands in 1915, and had the second highest admission rate as ll as the second highest noneffective rate, this year has dropped to 26 and 0.20 per 1,000 respectively, as compared with 131.31 and 4 per 1,000, respectively, in 1915. One hundred and forty-two es in all were reported during the year 1916. No discharges and deaths resulted in this number of cases.

MENTAL ALIENATION.

There were 50 admissions for mental alienation in 1916, with an mission rate of 4.32 per 1,000. In the United States the rate was 8 per 1,000. In 1915 the rates were 7.27 for American troops in Philippine Islands and 3.04 in the United States.

DIARRHEA AND ENTERITIS.

A marked increase over 1915 is noted in the cases of this disease, ng 609 in 1916 as compared with 449 in 1915. The admission rate r 1,000 in 1916 was 52.59; in 1915 it was 37.94; in 1914, 63.10; d in 1913, 67.48.

The noneffective rate for 1916 was 0.63 as compared with 0.51 r 1,000 in 1915, being a slight improvement over the rate for 1914, en it was 0.91.

TYPHUS FEVER.

No cases of this disease occurred among the American troops. cases were reported in the native troops from Camp Keithley. ere last year three cases were reported.

INVALIDING TO THE UNITED STATES.

The disease causing the highest number of men to be invalided me were, with actual numbers: Mental alienation, 50; tuberculosis, ; flat foot, 26; neurasthenia, 13; pleurisy, 11; and syphilis, 10.

TABLE No. 33.—*Enlisted men invalided home from the Philippine Islands, year*

PHILIPPINE SCOUTS.

The health of the troops (native) in the Philippines for the year 16 was very good, being a marked improvement over that for the ar 1915. The mean strength of these troops during the year was 579, as compared with 5,505 during 1915.

ADMISSIONS.

During the year there were 2,690 admissions for all causes, with a se admission rate of 482.17 per 1,000, as compared with 3,159 adissions and a case admission rate of 573.84 per 1,000 for the year 15.

The rate for disease for 1916 was 407.06 and that for injury 75.10 r 1,000, as compared with 482.65 for disease and 91.19 for injury in 15.

The following tabulation gives the admission rates for some of the incipal dieases in 1916 as compared with the year 1915:

dmission rates for some of the principal diseases among Philippine Scouts, years 1915 and 1916 compared.

	1916	1915		1916	1915
larial fevers	43.38	80.11	Dengue	11.12	16.71
onchitis	33.52	28.52	Dysentery	4.84	9.99
arrhea and enteritis	29.93	37.60	Tuberculosis (all)	3.05	4.54
nereal diseases	29.93	34.33	Ankylostomiasis	2.87	9.45

CONSTANTLY NONEFFECTIVE RATES.

The constantly noneffective rate for 1916 was 14.58 per 1,000, as mpared with 15.68 in 1915. The rate for disease was 12.43 per 000 in 1916 and 13.31 in 1915, while that for external causes was 14 per 1,000 in 1916 and 2.37 in 1915.

The following tabulation shows the noneffective rates for the rincipal dieases in 1916 as compared with 1915:

oneffective rates for some of the principal diseases among Philippine Scouts, years 1915 and 1916 compared.

	1916	1915		1916	1915
nereal diseases	1.79	1.96	Diarrhea and enteritis	0.33	0.45
larial fevers	1.14	1.54	Dysentery	.22	.56
onchitis	.74	.48	Mumps	.22	.17
ute abscess and cellulitis	.64	1.05	Rheumatism, articular	.16	.03
runcle and carbuncle	.42	.48	Ankylostomiasis	.06	.19
berculosis (all)	.36	.58			

From the comparisons afforded by these tabulations it is not that venereal diseases, which last year (1915) showed such mark improvement, during 1916 shows a slight improvement over 191 although still leading the list with the highest noneffective rate. T rate has been heretofore, with the exception of 1915, but a fracti of that for American troops in the Philippines, and the disastro results attending the development of a high rate for venereal diseas would be obvious. The most marked improvement is to be noted the admission rate for malarial fevers, being a reduction from 80 in 1915 over 43.38 in 1916. The rate for dengue shows a slight c crease for 1916 over that for 1915, yet the noneffectiveness from t disease is so small as to preclude its entry in the tabulation for t principal diseases. Diarrhea and enteritis show a slightly decreas admission and noneffective rate over that for 1915.

TABLE NO. 37.—*Movement of sick, Philippine Scouts, enlisted men, year 1916.*

	From all causes.		Excludi injuries, nereal d eases, v cinia, a alcoholis
	Total.	In hospital.	Total

Total losses	9.68		[illegible]
Noneffective	14.58	14.33	[illegible]
Average number of days lost:			
For each soldier	5.34	5.24	[illegible]
For each case	11.06	11.17	[illegible]

DISCHARGE FOR DISABILITY.

During the year 1916 there were 39 discharges from all causes a decrease from 1915 of 24. Of this number 36 were for disease d 3 for injury, making a discharge rate of 6.99 per 1,000. Tub culosis, the same as last year, is the cause of the greatest num of discharges, there being 16 discharges during 1916. Mental alie tion caused 4, leprosy 2, and neuritis none. In 1915 tubercul caused 25 discharges, mental alienation 16, and leprosy 2.

TABLE NO. 38.—*Causes of discharge for disability, Philippine Scouts, year 1916.*

DEATHS.

There were 15 deaths from all causes during 1916, with a rate 2.69 per 1,000, and 14 with a rate of 2.54 in 1915. Tuberculosis, hich causes the greatest number of deaths, for 1916 only had 1 eath, while in 1915 it did not appear among the diseases given. here was 1 death from homicide and 1 from suicide.

SPECIAL DISEASES.

TYPHOID FEVER.

There were no cases of this disease among the Philippine Scou

MALARIAL FEVERS.

The admission rate for all fevers of this class was 43.38 per 1,00 as compared with 80.11 in 1915 and 201.80 in 1914. This rate the lowest in the history of the Philippine Islands, an evidence the persistent and vigorous antimosquito campaign that is bei waged. Certain posts in the Philippines, however—notably Can Stotsenburg, Pampanga—continue to show high admission rates f malaria. This post is not properly screened, in spite of repeat recommendations. The same statement is true of other Army pos The relation of mosquitoes and other insects to disease incidence now so well known that to deter the matter of complete screeni of all quarters in the Army is inexcusable. "Lack of funds" "insufficient appropriations" for this important work should longer be accepted and the responsibility for this serious def definitely placed.

TYPHUS FEVER.

There were no cases of this disease among native troops at Ca Keithley, Mindanao, where last year 3 cases existed among t scouts.

VENEREAL DISEASES.

These diseases furnish an admission rate of 29.93 per 1,000, compared with 34.33 in 1915, a marked reduction. Of a total 167 admissions, 27 were for syphilis, 13 for chancroid, and 127 gonorrhea, as compared with 31, 17, 141, respectively, for 19 The noneffective rate for all venereal diseases was 1.79, as compa with 1.96 per 1,000 in 1915.

SMALLPOX.

Nine cases occurred during the year.

CHOLERA.

Two cases of this disease occurred during the year, with 1 dea

TUBERCULOSIS.

There were 17 cases of this disease, with an admission rate of 3 per 1,000, as compared with 25 cases and an admission rate of 4 in 1915. There was 1 death, 16 being discharged.

DYSENTERIES.

Twenty-seven admissions for this disease during the year, of which
mber 13 were classed as bacillary, 10 as entamoebic, and 4 unclassi-
d. The rate for this disease was 4.84, as compared with 9.99 for
15. The noneffective rate was 0.22 per 1,000.

DENGUE.

Dengue, or "breakbone fever," is an acute disease of tropical and
btropical countries, characterized by severe pains in the muscles
d joints and by an eruption similar to measles. The mortality is
actically nil. It has been demonstrated that it is transmitted by
e *Culex fatigans* species of mosquito.

Sixty-two cases of this disease occurred among the native troops,
th an admission rate of 11.12 per 1,000, and a noneffective rate of
26. There were no deaths.

DIARRHEA AND ENTERITIS.

One hundred and sixty-seven cases occurred, making an admis-
n rate of 29.93 per 1,000, as compared wtih a rate of 37.60 in
15. The noneffective rate was 0.33.

ALCOHOLISM AND ITS RESULTS.

Six admissions are recorded for this disability, the admission rate
ing 1.08 per 1,000.

BERIBERI.

Two cases of this disease occurred among the Scouts during the
ar, the admission rate being 0.36.

UNDETERMINED FEVERS.

There were 32 cases of undetermined fevers during the year.
nder this heading are included febricula, simple, continued, and
her fevers of undetermined causation. The admission rate was
74 per 1,000, as compared with 5.81 in 1915.

The following table exhibits the various surgical operations performed on the Philippine Scouts during the year:

PREVALENCE OF DISEASES, BY RACES.

With the exceptions of diarrhea and enteritis, furunculosis, malaria,
njunctivitis, trichophytosis, dysentery, and intestinal parasites, the
es for the Philippine Scouts were all lower than for either the white
colored American troops. It should be borne in mind that the
tive troops are serving in their own country under conditions natu-
to them, to which American troops are not accustomed.

The rates for the American white and colored troops and scou are compared in the following tabulation:

Comparison of general rates for American white and colored troops and scouts, year 191

	White.	Colored.	Scouts.
Admission rate	749.59	713.90	482
Noneffective rate	39.17	32.03	14
Death rate	5.05	7.73	2
Discharge rate	16.19	22.12	6

TABLE NO. 42.—*Important diseases by races, Philippine Islands, year 1916.*

Diseases.	Admission rates.					
	White troops.		Colored troops.		Philippine Scouts.

Pneumonia (lobar)	.66	2.34	....	3.45	2.69	

SANITATION IN THE PHILIPPINE ISLANDS.

The department surgeon, Philippine Department, reports as lows:

The admission rate was 7.75 per 1,000 of strength as against 9.31 in 1915; the non-ective rate was 24.33 as against 25.8, and this decrease in both the admission rate l constantly noneffective was due to dengue, venereal diseases, and malaria. e admission rate for dengue was reduced from 90.1 in 1915 to 11.3; venereal diseases m 184.7 to 160.5, and malaria from 65.6 to 54.8 per 1,000.

Prevalence of Special Diseases.

VENEREAL.

There were 3,079 cases of venereal diseases admitted, of which 2,274 were new es and 805 were readmissions of those previously admitted for the same disease. While venereal disease continues to be the most frequent cause of admission on k report, it will be noticed that the admission rate per 1,000 has made a steady line (with exception of 1913), as shown by the following figures:

1	231.7	1914	167.4
2	202.1	1915	184.7
3	124.1	1916	160.5

The admission rate per 1,000 for this disease at the principal American posts was as ows:

Admission rates per 1,000.

Station.	1915	1916	Station.	1915	1916
atsin, China	596.4	378.6	Camp Stotsenburg	238.8	230.3
gan Barracks	434.5	593.3	Cuartel de Espana	226.2	201.8
np Eldridge	369.9	325.1	Fort William McKinley	203.0	197.8
np McGrath	246.9	168.9	Fort Mills	124.0	99.2

The question of the control of venereal disease apparently depends to a large extent the zeal with which the authorities, both line and medical, enforce the regulations ating to these diseases. It is believed that when a command has an excessive nereal record that it will be found that in other respects discipline is lacking.

The extent to which venereal disease may invade a command is shown by the ort of the surgeon at Camp Eldridge, in which it is shown that when a battalion the Thirty-first Infantry reported there from duty at Regan Barracks, 120 of the nmand of 382 men had venereal disease, and after a syphilitic survey, 108 of the nmand showed syphilis.

Since this battalion has been at Camp Eldridge, the number of new cases of venereal ease has been very small.

MALARIA.

The malaria situation continues to show great improvement, the admission rate 1,000 being 54.8 per 1,000 against 65.6 per 1,000 in 1915, 93.9 in 1914, 125.4 in 13, and 188 in 1912. The rate per 1,000 for 1916 was the lowest since American upation.

Admission rates per 1,000.

Station.	1915	1916	Station.	1915	1916
Ludlow Barracks	220.4	38.6	Camp Eldridge	27.5	27
Camp Stotsenburg	135.4	186.9	Warwick Barracks	25.9	[illegible]
Fort Mills	88.9	61.3	China Expedition	24.3	9
Pettit Barracks	58.9	40.2	Fort William McKinley	17.5	29
Augur Barracks	57.5	96.3	Camp John Hay	13.1	14
Fort San Pedro	56.4	11.8	Camp McGrath	12.4	1
Camp Keithley	41.3	12.8	Cuartel de Espana	11.4	[illegible]
Regan Barracks	30.3	15.3			

The increase at Augur Barracks was largely due to disease being epidemic at th station during the month of February, 34 cases (total cases for the year, 90) bei reported in that month.

Malaria became epidemic at Camp Stotsenburg in March and December, the being 77 and 54 cases, respectively, a total of 131. Total cases for the year from th station were 383.

These rates can be improved, and will be, as all the posts are screened. This wo of screening is very gradually being done by the Quartermaster Department. T post of Camp Stotsenburg is only partially screened at present. Augur Barracks, Jolo, another malarial station, is only two-thirds screened.

Antimalarial measures, which are under the direct control of the Medical Depa ment, are very carefully carried out at all posts.

DENGUE.

The admission rate for this disease has been reduced from 90.1 in 1915 to 11.3 p 1,000. There was an actual reduction of 1,523 cases. Total of cases admitted in 19 was 1,740; in 1916, 217.

DYSENTERY, AMŒBIC AND BACILLARY.

The total admissions in the department for 1916 were 170 as against 122 for 19 an increase of 48 cases or 8.8 per 1,000 as against 6.3 for 1915.

This is largely due to the great increase in admissions for this disease at Ca McGrath, where the disease has been endemic during the past year, there being actual increase of 36 admissions over the figures for 1915 (41 in 1916 against 5 for 191 all entamœbic.

DIPHTHERIA.

Only one case reported during the year, an American white at Fort Mills duri October.

Three cases of this disease occurred in the family of an officer residing in Man during August (wife and two small children), which were isolated at the departm hospital. All made uneventful recovery.

Two cases of carriers (both colored) were isolated under canvas at Camp Stots burg during February, one of whom was returned to duty the following month negati for diphtheria bacilli.

The other case (S. & W. card 28070, Camp Stotsenburg, February, 1916) persists giving a positive reaction for diphtheria bacilli, and shows no tendency to impro It is believed that the soldier is a permanent carrier and that the organism has habitat in the frontal sinus. Patient was transferred on December 7 to departm hospital, Manila, by motor ambulance, where he remains on the last day of the ye

SMALLPOX.

Nine cases, with one death, all among Philippine Scouts at Augur Barracks, which station this disease was epidemic from March to September, there being cases among the civilian population admitted to hospital during this period with deaths.

TYPHOID.

No case reported during the year.

PARATYPHOID.

)ne case occurred (American) in China expedition during October.

LEPROSY.

[wo cases were discovered among the Philippine Scouts at Fort Mills. Both were charged on certificate of disability and turned over to the civil authorities.

BERIBERI.

[here were two cases of beriberi; one at Augur Barracks and one at Pettit Barracks. th were Philippine Scouts.

SCARLET FEVER.

Vine cases, with one death, occurred during the year. All among American troops China.

CEREBROSPINAL MENINGITIS.

[hree cases appeared among native troops with two deaths, one at Fort Mills dur- February, and two at Augur Barracks during April and June. This disease has isted in epidemic form at Jolo in the vicinity of Augur Barracks among the native pulation.

CHOLERA.

ight cases of cholera occurred, 5 among Americans and 3 among Philippine Scouts. ly 1 death occurred, which was a native soldier who had contracted the disease ile on furlough in Manila from Camp Nichols. Patient was not treated in military spital. Cases occurred at the following stations: Camp Keithley, 1 scout in April; rt William McKinley, 1 American in July, 2 Americans in August, and 1 American September; Cuartel de Espana (from Estado Mayor), 1 American in September; mp Nichols, 1 scout in October, and Fort Mills, 1 scout in October.

holera has been quite prevalent during the year among the civil population oughout the entire archipelago, particularly so in Manila and immediate vicinity, ere cholera is believed to be due to a great number of cholera carriers who are ally harmless, but who become active sources of infection following errors in diet. e elimination of carriers from employees engaged in handling of water and food plies probably in some measure at least, accounts for the very few cases occurring nearby garrisons.

several cases occurred among the civilian native population of Fort Mills and Fort lliam McKinley.

SANITATION AND CONDITIONS AT INDIVIDUAL POSTS.

AUGUR BARRACKS, JOLO.

smallpox was epidemic from March 16 to September 30, and appeared again during cember. The surgeon reports:

"In order to understand the difficulty of controlling the epidemic it is necessary to te that there were 570 women and children (scouts' and quartermaster employees' nilies), and 120 quartermaster employees (packers and native employees) of whom re than half were living off the reservation in the town of Jolo and the adjacent rrios of Tulay and San Ramundo. Further, to realize the opposition to vaccina- n, particularly among the families of the two Moro companies, they in many stances were concealed or sent away to return only when sick with smallpox, or owing that they had been exposed. The epidemic started in the civil population; date is not known. The first case requiring military care was a quartermaster ployee (native) taken sick on March 16, 1916.

"A smallpox camp was established and all cases isolated; daily visits to all known mbers of scouts' families, and to organizations in which a case occurred were made. ccination was employed and revaccination to even the sixth time in some instances. ere were all grades of the disease seen, from the mildest to the most severe confluent morrhagic form which caused all of the deaths—except one child convalescent m a mild attack who died suddenly without cause; no autopsy. During the period ted 15 deaths occurred of which only one was a soldier."

The surgeon concludes as follows:

"As a result of the difficulties encountered in dealing with these civilian element so scattered throughout the towns, they have been brought into the reservation an will be comparatively easily controlled hereafter should any epidemic diseases appear.

He remarks as follows with reference to venereal diseases:

"Venereal diseases have at all times been prevalent but to no great extent. The have been treated in hospital during early stages (open lesions in syphilis, and unt discharge has greatly lessened in gonorrhea), continuing treatment under restrictio after return to duty. The usual prophylaxis has been employed to prevent infe tion and instruction given frequently in these subjects by medical officers."

This station shows an increase in admission rate for malaria, all due to diseas becoming epidemic during month of February after field service.

CAMP ELDRIDGE, LAGUNA.

There have been very few cases of malaria, the admission rate being slightly low than that for 1915.

The venereal rate for this station, while lower than that for 1915 (369.9 per 1,0 against 325.1 in 1916), will undoubtedly show a large increase for the coming yea due to this station inheriting the first battalion of the Thirty-first Infantry on Decen ber 29, 1916, from Regan Barracks. The surgeon remarks as follows:

"Until the arrival of the first battalion of the Thirty-first Infantry at this post December 29, 1916, there were no prevailing diseases. In this battalion there ar in a total enlisted strength of 382 men, 150 cases of active venereal disease und treatment; most of these men have been doing garrison duty, but many are at prese physically incapacitated for field service. The number of each variety of venere disease at present under observation and treatment is as follows: Syphilis, 80 case chancroids (unhealed), 46 cases; gonorrhea, acute and chronic, 15 cases; venere warts, 4 cases; buboes, suppurative, 5 cases; total, 150."

The special steps taken to control venereal disease as reported by the surgeon ar

"1. Treatment in hospital of all infectious syphilitic and acute gonorrheal cases.

"2. Restriction to limits of post of all other venereal diseases during infectious stag

"3. Maintenance of an excellent venereal prophylactic station, very accessib to houses of prostitution and open at all hours.

"4. Lectures by medical officers to command on personal sanitation.

"5. The investigation of the origin of all cases of venereal disease and subseque isolation of the infected woman.

"6. Institution of semimonthly inspection of all prostitutes in Los Banos by medi officers during the latter part of November, 1916. Prior to this a weekly inspecti of these women was made by the provincial health officer. He now makes two insp tions monthly.

"7. Semimonthly physical inspection of the entire command by medical office

"8. At present all cases of infectious venereal disease not in hospital are restricted the limits of post, required to report to the noncommissioned officer in charge of quart in each company every two hours. The military police on duty in the town of I Banos are furnished with a list of all those so restricted and have instructions from t post commander to arrest any such men found without the limits of the post."

CAMP JOHN HAY, BENGUET.

There are no malaria-carrying mosquitoes in the vicinity of this post. Only ei cases reported druing the year; all imported.

Venereal diseases are scarce, notwithstanding one company of American tro has been stationed at this post since February.

The surgeon reports:

"Venereal prophylaxis installed in hospital given any hour of day or night medical department attendant, who is carefully instructed in the administrat of same. Bimonthly physical inspections of the command, etc."

CAMP KEITHLEY, MINDANAO.

The surgeon reports all existing orders and regulations for venereal disease being complied with. This disease not sufficiently prevalent to warrant spe steps, only seven cases during the year.

The malaria rate was again reduced, the rate per 1,000 for 1916 being 12.8 aga 41.3 in 1915. The surgeon reports:

"For control of malaria all cases were thoroughly treated before final discharge, d all requirements on malarial register complied with; blood examinations made all suspicious cases; use of mosquito bars by all troops, and breeding places of osquitoes drained or oiled."

Chicken pox was prevalent in January, 12 cases being reported.

There has been an occasional case of dengue throughout the year, but not considered idemic.

Mosquitoes are fairly numerous coming from nearby swamps bordering Lake Lanao.

In regard to sanitary defects the surgeon reoprts as follows:

"As mentioned under this heading in last report, the principal sanitary defect has en the lack of quarters available for the families of enlisted men, Philippine Scouts, hich has resulted in overcrowding in many instances."

CAMP M'GRATH, BATANGAS.

The prevailing diseases were venereal and dysentery contracted in adjacent town Batangas.

The physical examination of the command, also the prostitutes, and isolation of fected cases of either, has been a great factor in again showing a material reduction the venereal rate, which was reduced from 246.9 per 1,000 in 1915 to 168.9 per 1,000 1916.

With regard to dysentery, the surgeon reports as follows:

"Investigation shows that the infection is brought into the garrison from the town of atangas or other outside sources, in evidence of which it is stated that the only case dysentery appearing in any of the officers' or noncommissioned officers' families that of a native servant admitted in September, 1916.

"The amœbic incidence is not confined to one organization, nor does it seem to ave a seasonal variation. This would seem to indicate that the etiological factors ere constantly present, but the entire command was not exposed, which opinion further strengthened by the absence of infection of the officers and noncommissioned ficers, and their wives and children, who have the same water and food supply as e rest of the garrison."

A carrier was detected in one company in the person of a cook. This company had ore admissions than any other for 1916.

Bacteriological examinations for amœbæ will be made at intervals.

CAMP STOTSENBURG, PAMPANGA.

Malaria and venereal continue to be the prevailing diseases.

With reference to malaria the surgeon reports as follows:

"This disease has at all times flourished at this post, and until the so-called scout st is abandoned the malaria incidence will be excessive. In spite of the active anti-osquito measures constantly practiced, the malaria rate has remained high, at one me reaching in the scout post 99 per 1,000 per month (March, 1916). Screening of e barracks and quarters, now under way but not completed, will tend to lower the te, but it will probably then remain excessively high. This is believed to be due the large number of malaria carriers among the native population at Sapang Bato and er whom the post authorities can exercise no control. The quartermaster corral is tuated directly across the creek from the barrio, and adjoining this corral there is a ntinuous line of cover through adjacent buildings, through which malaria-infected osquitos from Sapang Bato may travel to the barracks occupied by the first battlion Second Field Artillery. The records of this hospital show that the occupants these barracks have suffered continuously and excessively from malaria, and its ntinued high rate may be expected so long as the scout post continues to occupy s present location.

"Active antimosquito warfare is constantly waged. This includes searching for ater and moist spots, petrolization, the cutting and burning of grass and brush for considerable distance about post, the systematic examination of all natives before ithorizing their employment on post, the careful isolation and hospital treatment all malaria cases until they cease to be carriers."

Screening has now been authorized on all barracks and quarters and is well under ay.

The venereal rate for this station is a trifle lower than for the previous year. This roblem is partially solved at this station by the toleration of a so-called model arrio, situated about 1 mile south of the post, which is satisfactorily operated.

The Banban River supply is now being used for all purposes. Drinking water is oiled or filtered before use. A new artesian well has been bored and is awaiting istallation of machinery.

Plans and specifications are now being prepared for the construction of a ne hospital.

FORT MILLS, CORREGIDOR, AND SUBSTATIONS.

Malaria and venereal diseases have been prevalent during the year among th command, and malaria, skin, and eye diseases and intestinal parasites among th native population. There have occurred during the year two cases of leprosy amo Philippine Scouts (both discharged on surgeon's certificate of disability and turn over to civil authorities) and one case each of cerebrospinal meningitis (Philippi Scout), cholera (Philippine Scout), and diphtheria (American); also three cases cholera among the native civilians.

There has been a decided decrease in both the venereal and malarial rate. Th surgeon reports as follows:

"In the case of venereal diseases, in additional to the measures required by regul tions, steps have been taken as follows:

"Weekly examination of all known prostitutes in the vicinity. In the case malaria, aside from the usual preventative measures, i. e., screening of buildin use of mosquito nets, occasional use of quinine prophylactic, etc., two important mea ures are now under way—the clearing of underbrush and the routine survey of natives coming on or living on the island for blood infections. Native gamete carri are as a rule deported. Others are controlled by treatment or deported."

It is interesting to note that while this station had a mean strength of 4,487 duri the year (not to speak of a native barrio with a population of about 5,000, situated and around the island's port of entry) the command shows a greater continued mov ment for betterment than any post in the department, the average daily sick the year being 76; constantly noneffective per 1,000, 16; venereal rate reduced fr 124 per 1,000 in 1915 to 99.2 and malarial rate from 88.9 per 1,000 in 1915 to 61.3 1916.

FORT SAN PEDRO, ILOILO.

The surgeon reports skin, respiratory, and venereal diseases as prevailing duri the year.

Malarial rate has shown a decided reduction over the figures for 1915, being on 11.8 per 1,000 against 56.4 for 1915.

The surgeon states:

"All cases of venereal disease are treated at hospital. Chancroid cases return to duty when completely cured. Gonorrheal cases retained to hospital until d charge ceases, when they are returned to duty but kept on venereal list and requir to report daily for observation and treatment until cured. All cases of syphilis, wh danger of infecting others exists, are retained in hospital for observation and tre ment."

FORT WILLIAM M'KINLEY, RIZAL.

There has been nothing of interest except the six cases of Asiatic cholera, all which were contracted outside of the post. The cases of malaria which occurr have mostly been of extraneous origin. There were a number of cases among t enlisted personnel who were on topographical work near Aparri.

The sewage-disposal system which had given a great deal of trouble has been rem died by the installation of a new Imhoff septic tank, which seems to work satisf torily in every way.

LUDLOW BARRACKS, MINDANAO.

There has been no disease that could be called prevalent during the year. T admission rate per 1,000 for all disease was 438.

Malaria, which in former years caused the greatest number of admissions, h practically been eliminated, as shown by the admission rates of 791.3, 220.4, and 3 per 1,000 for the years 1914, 1915, and 1916.

The surgeon reports the same antimosquito measures in use as reported in the l annual report from this office, which have proven entirely satisfactory.

The usual measures employed in combating venereal diseases have contin effective, and the rate per 1,000 for this class of disease was 24.6.

The following report is made regarding sanitation at the post:

"Garbage, which prior to May, 1916, was dumped on the ground in the immedi vicinity of the post and an attempt made to burn it, is now being dumped into sea.

"Recommendations that the old guardhouse, which is located in the remains of old Spanish redoubt and is unfit for occupancy, be rebuilt or a new one construc ve been made, and money has already been asked for this purpose. It is expected t a new one will be built in the near future.

"The old system of disposal of human excreta has been replaced by water-flushed sets."

CITY OF MANILA.

The following stations are located within the city limits: Cuartel de Espana, Cuartel Infanteria, department hospital, Estado Mayor, Fort Santiago, medical supply pot, Manila ordnance depot, and quartermaster depot.

Cuartel de Espana, which normally had a garrison of one battalion of infantry, plus imental headquarters, now has two battalions, due to moving of white troops from mp Eldridge.

Cuartel de Infanteria has one company of Signal Corps.

Estado Mayor consists of two companies of Infantry.

Fort Santiago has been increased to two companies of Infantry as a headquarters rd.

The regular corps detachments are stationed at the medical supply depot, the lnance depot, and the quartermaster depot.

CUARTEL DE ESPANA.

Tonsillitis was common during early part of the rainy season. This was probably e to overcrowding during alterations in barracks at a time when infectious diseases the upper air passages were common in Manila.

A large number of cases are undergoing treatment for dhobie itch and an impetigoe eruption which as a rule readily responds to treatment and which does not incacitate for full duty.

The venereal diseases have been in fairly large numbers, particularly because the ation of the post in a city with opportunities for infection, and because the regiment made up largely of soldiers in their first enlistment. The rate, however, is lower n for the past two years, being 201.8 per 1,000 against 226.2 for 1915, and 203.4 for 14.

The new artesian well which was completed the latter part of 1915, the water of ich was intended for the use of the entire military population of Manila, was finally andoned as a frequent bacteriological examination of the water showed a contamition which finally led to the discontinuance of the water for drinking purposes. ce April all water for drinking and cooking purposes has been distilled by the artermaster distilling plant.

Disinfection of swimming pool with copper sulphate was instituted early in the year, d has been continued since. There have been no cases of infection traceable to use of the pool.

The present sanitary condition of the post is good except for the unavoidable dust d disturbance due to building construction which will probably be completed ly in the year.

FORT SANTIAGO.

There have been no prevailing diseases during the year.

A large civilian population of nearly 3,000, which includes the employees and famis of civilians employed in and around department headquarters, depot quarterster and land transport corral, are taken care of at this dispensary, and the surgeon orts as follows:

"In order to detect communicable diseases, monthly physical inspections of all ilians employed have been made. In this way several active cases of tuberculosis d syphilis have been eliminated. In order to protect against cholera and other instinal diseases, the various sources of drinking water are checked up by frequent cteriological examinations, and all civilians concerned in the handling of drinking ter or food products are examined to determine their freedom from cholera or other testinal infections."

DEPARTMENT HOSPITAL.

There were 1,143 cases transferred to the department hospital for treatment, namely, 52 American white, 34 American colored, and 57 Philippine Scouts. An average 102 patients was in hospital during the year, of which enlisted men and officers was and civilians 23.

Considering age and numerous repairs, the buildings are in fair condition. The sewage d drainage systems are defective in rainy weather, but could not be improved witht considerable expense.

The artesian well commenced in the last part of 1915 was finally completed on De cember 11, 1916, and is now being used. The bacteriological examinations made fro this well, extending over a period of two weeks, specimens being obtained daily fro the main of the well itself, and from the storage tank, show the water from the mai to contain an average of 300 colonies per cubic centimeter, and the water from the tan to contain an average of 1,200 colonies per cubic centimeter. Presumptive tests f the presence of *B. coli* were negative during all examinations. Practically no diffe ence was found to exist chemically between the water from the main and tank.

The bacterial work was done at the department laboratory by a first lieutenan Medical Corps.

PETTIT BARRACKS, MINDANAO.

There have been no prevailing diseases at the post. The admission rate per 1,0 continues to be the lowest in the department, being 316 against 427 for 1915. In t town of Zamboanga there have been some cases of typhoid fever, but no cases appear among the command.

Only 19 cases of malaria and 8 cases of venereal disease (1 of which was new) we reported during the year. The mean strength of the command was 472. The surge reports as follows:

"For control of venereal disease, existing War Department orders are careful carried out. Malaria cases are kept under treatment for 21 days following dischar from hospital, and four months later 21 days' treatment is continued."

Regarding sanitation it is stated:

"The barrio of Santa Barbara adjoining the post has been put under the joint cont of the civil and military authorities and its condition much improved. A sanita latrine was built by the local health authorities, and the daily police of the barrio under the direction of a sergeant of the line who reports daily to the surgeon. T scheme has worked out very satisfactorily, and great credit is due Gov. Frank C penter for his hearty cooperation in improving conditions immediately adjoining t post."

REGAN BARRACKS, ALBAY.

The venereal rate at this station, which was second only to China during the last ye has again increased and now is the highest in the department, being 593.3 per 1,0 against 434.5 for 1915.

The high rate reported by the surgeon is due to lack of cooperation on the part of t civil authorities in the control of prostitutes.

Special steps in controlling venereal diseases were:

"The venereal cases are restricted to the post and if they have failed to take the p phylaxis, are brought to trial by summary court-martial. Most of the cases are tak in the hospital for some time, and during this period lose their pay, with the idea impressing the seriousness of the disease. An effort was made to cooperate with t health authorities of the Province, with a view of having all infected prostitu confined until cured, but it has failed. The examination and laboratory work of t prostitutes was done by the surgeon free of charge. The health authorities claim after trial, that they, the prostitutes, could not be confined without due process of la and it is almost impossible to get any one to swear out a warrant."

This condition has been remedied by the removal of the American troops (the fi battalion of the Thirty-first Infantry) to Camp Eldridge, Laguna, during Decemb 1916, where conditions are much better.

The malaria rate is practically nil, only 13 cases appearing during the year, givi an admission rate of 15.3 per 1,000 against 30.3 in 1915. The usual antimosqu measures are carried out.

WARWICK BARRACKS, CEBU.

There was no disease present that could be called prevalent. Dengue, which h been endemic, has almost been entirely eliminated, only 30 cases appearing dur the year.

But little venereal disease has occurred at this post. The prescribed semimontl physical examination of enlisted men is performed, and every reasonable facilit given which might encourage the faithful use of the prophylactic system.

Malaria is not prevalent at this station, and except for imported cases, seems to nonexistent in Cebu. The usual antimosquito measures are, however, employed.

TIENTSIN, CHINA, AND SUBPOSTS OF CHINA EXPEDITION.

enereal disease continues to be the prevailing disease, although it is interesting ote that the rate per 1,000 has been cut almost in two. The rate per 1,000 for 1916 378 against 596.4 in 1915. The surgeon attributes this great improvement to e careful prophylaxis, and the continuance in hospital of all cases until no longer ctive. Considering local conditions, the results obtained are excellent.

he malaria rate has been very low, only 9.6 per 1,000 against 24.3 for 1915.

neumonia has been extremely fatal, but the cases have occurred in drinkers.

he troops are quartered in buildings constructed for commercial purposes, and e are not satisfactory, being crowded and not well ventilated. The removal of t soil and urine, which is done by coolies, is only a makeshift arrangement and es much to be desired.

ew buildings, to be rented for barracks and hospital, are now in course of conction, and will in a measure correct some of the defects of the present arrangement.

he health of the command has shown a great improvement during the past year, admission rate being reduced to 979 per 1,000 from 1,533 for 1915.

n conclusion, the department surgeon desires to say that the health of troops ioned in the Philippine Department has shown a decided inprovement over that revious years. The gradual abandonment of small posts, the concentration merican troops at posts in and around Manila; the fact that active operations on part of troops (both American and Philippine Scouts) have not been necessary he same extensive scale as in former years, the hearty cooperation of the civil orities (especially in regard to the cholera situation) have all tended to reduce morbidity rates in this department, as shown by the following tables:

Year.	Mean strength.	Admission rate.	Constantly noneffective per 1,000.
	18,041	1,389	46.5
	19,294	1,298	45.6
	17,069	1,259	40.2
	17,766	1,226	37.4
	19,197	1,130	37.0
	18,221	863	26.9
	16,954	865	28.0
	19,307	931	25.8
	19,172	775	24.3

ith the rate for malaria the lowest since American occupation, dengue practically inated from the causes of admission, venereal diseases (with exception of 1913) er than any year since 1911, alcoholism and tuberculosis also showing reductions r previous years, a result largely attributed to the zeal, efficiency, loyalty, and l of the medical officers who, with few exceptions, have displayed an energy and lligence that make them a credit to the Medical Corps of the Army, a gradual uction in all morbidity figures in the year to come can be looked for.

SPECIAL DISEASES.

he surgeon, Fort William McKinley, P. I., reports as follows:

uring July two enlisted men, members of Field Hospital Company No. 4, who e in contact with a cholera case in Santa Ana, were placed in isolation at hospital. e case of Asiatic cholera developed in the person of a private, first class. The ient progressed favorably.

he cases of cholera mentioned in previous reports made satisfactory recoveries l were returned to duty. Three new cases were admitted during September, as ows: One soldier from command, one civilian employed as a packer, and one native orer employed at the pumping station. The soldier and civilian packer are now valescent. The native laborer was transferred to San Lazaro, Manila, P. I.

ne case of Asiatic cholera admitted December 7, and died December 9, occurred a civilian, 60 years of age, employed in the Quartermaster Corps. The residence he cholera case was thoroughly disinfected and contacts isolated.

The department surgeon, Philippine Department, in a speci report on cholera, states:

> The situation in Bulacan Province, and especially in the town of Hagonoy, v recently rather acute, but this is clearing up. Iloilo is probably at present the m threatening point outside of Manila, which is now the point of greatest danger.
>
> The general situation is not alarming at present, but is one fraught with possibiliti The bureau of health and the office of the department surgeon are in close touch a are working in cooperation. The director of health being also the chief quaranti officer, the preceding remark is also applicable to the quarantine service.
>
> Cholera is epidemic at Nagasaki, Japan, although it is understood that this has been officially announced. All precautions are taken with reference to trans-Pac transports calling at that port en route to San Francisco, no passengers being allow to land, and all supplies which could possibly introduce infection on the ship be prohibited.
>
> All troop-class passengers are isolated for five days and examined as suspec carriers before embarkation on trans-Pacific transports, and first and second cl passengers are subjected to the usual examination.
>
> A campaign of examination of cooks, commissary employees, watermen, etc., being conducted. Recently a native quartermaster employee engaged in fill water coolers at department headquarters was found to be a cholera carrier, and v sent to San Lazaro Hospital.

HAWAII.

he mean enlisted strength of the troops serving in Hawaii during
year 1916 was 8,476, as compared with 8,572 during 1915. Of
se, 1,808 were colored. A remarkable feature in connection
h the rates for Hawaii in comparison with those for the United
tes is that while the total admission rate, noneffective, discharge,
death rates are lower, yet the individual rates for the preventable
ases are somewhat higher, especially that for venereal diseases.
average number of days' treatment for each case was 13.67, as
pared with 15.06 for the United States.

ADMISSION RATES.

he admission rate during 1916 was 514.51 for total enlisted men
1,000, as compared with 568.94 for 1915. The rate for disease
e was 405.50 per 1,000 and that for external causes 109.01.

CONSTANTLY NONEFFECTIVE RATES.

he constantly noneffective rate was 19.22 per 1,000 for all
ses in 1916, as compared with 20.44 for 1915. The rate for
ase was 15.31 and that for external causes 3.91 per 1,000, as
pared with 16.39 for disease and 4.04 for external causes in
5.

DISCHARGES ON CERTIFICATES OF DISABILITY.

he rate for discharge for disability was, for all causes, 15.57
1,000, 13.69 being for disease and 1.89 for external causes. In
5 the total rate was 10.92, that for disease being 9.79 and for
ernal causes 1.13 per 1,000.

DEATHS.

The death rate (total) was 4.84 per 1,000, that for disease being
5 and for external causes 3.19, as compared with a total rate of
4, 2.25 for disease and 0.79 for external causes per 1,000 in 1915.
actual numbers 41 deaths occurred among the enlisted personnel,
being due to disease and 27 to external causes. Nine of these
ths from external causes were due to suicide; 11 from drowning,
idental; 4 from homicide; and 3 from traumatism by fall.

TABLE No. 43.—*Influence of station on officers and enlisted men, Hawaiian Department, year 1916.*

Hawaiian Department.	Mean strength.	Ratio per 1,000 of mean strength.												Average number of days lost.			
		Admissions to sick report.		Discharged on certificate of disability.		Deaths.		Total losses.		Noneffective from sickness.				From all causes.		Excluding injuries, venereal diseases, alcoholism and vaccinia.	
										From all causes.		Excluding injuries, venereal diseases, alcoholism, and vaccinia.					
		From all causes.	Excluding injuries, venereal diseases, alcoholism, and vaccinia.	From all causes.	Excluding injuries, venereal diseases, alcoholism, and vaccinia.	From all causes. SPECIAL DISEASES.

TYPHOID FEVER.

Two cases were reported during the year 1916.

PARATYPHOID FEVER.

o cases of this disease occurred.

MALARIA.

ighteen cases were reported during the year.

SMALLPOX AND VARIOLOID.

one occurred.

MEASLES.

wenty-three cases occurred.

INFLUENZA.

ne hundred and fourteen cases reported with an admission rate of 7 per 1,000.

DYSENTERY.

hirty-three cases reported during the year.

BRONCHITIS.

his disease caused the lightest number of admissions, venereal ases excepted, 166 cases being reported, with an admission rate 8.89 per 1,000.

TUBERCULOSIS.

here were 28 cases, 24 of which were pulmonary tuberculosis, and tal of 6 deaths in all.

VENEREAL DISEASES.

here was a slight decrease in the venereal rate for 1916 over 1915, cases occurring, with an admission rate of 94.78. Of these cases were syphilis, 243 chancroid, and 410 gonorrhea.

ALCOHOLISM AND ITS RESULTS.

here were 97 cases admitted for this cause, with an admission rate 1.04, which was slightly lower than for 1915.

DIARRHEA AND ENTERITIS.

ne hundred and forty-five admissions are chargeable to this cause, ducing an admission rate of 16.50.

HEMORRHOIDS.

here were 77 cases admitted during the year.

MENTAL ALIENATION.

Forty-three cases of mental alienation were reported, giving admission rate of 4.89, an increase over 1915.

Periodic prevalence of epidemic diseases and pneumonia in Hawaii; also the numbe gunshot cases, by months.

SANITATION.

The department surgeon, Hawaiian Department, reports as follows:

here has been a decided decrease in rates of admissions and days lost for diseases injuries in line of duty, with a proportionately greater increase in the same for in line of duty, over the previous years in which Hawaii has been a separate artment.

he diseases and injuries not in line of duty are mainly due to disobedience of ers, and should rather be charged against discipline than against sanitary conions. With this view one may say that health conditions are good.

he department has been remarkably free from epidemic diseases. The rate of cases of venereal disease contracted in Hawaii has been increased from 67.5 per 00 to 76.5; the days lost from 1,514 to 1,565.

ne enlisted man was discharged on account of surgeon's certificate of disability for hilis, not contracted in line of duty.

here were 154 patients transferred to the Letterman General Hospital. Of this mber, 37 were cases of insanity, 28 tuberculosis, 19 results of injuries, 12 syphilis, all others 58. Attention is again invited to the high rate of mental cases.

here were 24 deaths from various causes, 19 in line of duty and 5 not in line of y.

SANITATION OF POSTS.

he following sanitary defects noted are not yet reported as corrected:

FORT KAMEHAMEHA.

idge ventilation full length of all kitchens in the barracks.

rainage from company barber shops into rock pile drain in front of barracks.

ow places and borrow pits around barracks, quarters, and batteries should be filled .

arrack water-closets should be removed to properly constructed building in rear barracks.

he following remarks of the quartermaster general relative thereto are contained ninth indorsement, office of the quartermaster general, December 13, 1916, on itary report, Fort Kamehameha, for October, 1916:

‘1. * * * That no changes in the construction of the barracks' kitchen roof are ommended until it has been determined that the steps already taken to improve ventilation are unsuccessful.

‘2. With reference to the drainage from the company barber shop commented on, it is the opinion of this office that its disposition should produce no nuisance.

‘3. The grading of low places and filling of borrow pits around the barracks and arters would involve a considerable expenditure of money, and as no funds are ailable at this time for this purpose the matter will have to be held in abeyance til additional funds are appropriated by Congress.

‘4. With reference to the objectionable location of the barrack water-closets this tter will be given consideration when report accompanied by estimates is received m the commanding general, Hawaiian Department, showing additional construcn, alterations, etc., required at Fort Kamehameha."

s stated in last report the plan of the new barracks overlooked certain essentials sanitation, and changes in original plan have further increased the difficulties. is possibility could probably be obviated in future if in revision of Army Regulans paragraph 1386 read as follows:

"The Medical Department is charged with the duty of investigating the sanitary ndition of the Army and making recommendations in reference thereto, of advising th reference to the location of permanent camps, posts, and the sanitary arrangent of barracks, quarters, and buildings occupied by troops or under military control, adoption of systems of water supply and purification, and the disposal of wastes, th the duty of caring for the sick and wounded, making physical examinations of officers and enlisted men, the management and control of military hospitals, t recruitment, instruction, and control of the enlisted personnel of the Medical Depa ment and of the Nurse Corps, and furnishing all medical and hospital supplies exce for public animals.

FORT SHAFTER.

The imperfect and inadequate sewage plant at Fort Shafter, referred to in la annual report, was made the subject of an exhaustive special sanitary report f warded with the January, 1916, report from this station. This matter is receiving t attention of the War Department. In accordance with instructions of the Secreta of War in sixteenth indorsement, July 18, 1916, on sanitary report, Fort Shafter, December, 1915, a cross-section survey and contour map of Fort Shafter, for use planning sewage treatment works, were forwarded to The Adjutant General by d partment commander, October 21, 1916. In the meantime the present means sewage disposal, while unsatisfactory, is being maintained in as good condition possible.

SCHOFIELD BARRACKS.

The following recommendations with reference to sanitary conditions at Schofie Barracks, made in previous sanitary reports, are repeated:

"That a guardhouse be erected in place of the stockade camp for general prisone

"That permanent roads be built to replace the quagmires now used as roads.

"That the makeshift and partial sewer system be extended to all parts of the p and completely modernized."

These recommendations have been discontinued upon receipt of the followi information from the office of the quartermaster general:

"On April 10 estimates were forwarded by this office for submission to Congr for funds to complete the accommodations at Schofield Barracks. Said estimate v in the sum of $2.077,263. Should this appropriation be made, funds will be availal for the construction of a permanent guardhouse at Schofield Barracks, for constru ing permanent roads, and for water and sewer systems at the cantonment.

"The condition of the septic tanks of the sewage-disposal plant at Schofield B racks, referred to in last report, was made the subject of a special communication The Adjutant General by the commanding general, Schofield Barracks, March 1916. Specific instructions for the working of this plant were received from the qu termaster general, and under date of May 17, 1916, the quartermaster, Schofield B racks, reported 'there are very few flies at the septic tank, and since the mat h thickened the odor has been greatly reduced.' No further complaints from this sou have been received."

DEPARTMENT HOSPITAL.

Quarters for medical officers and noncommissioned officers of the Hospital Co are required. The War Department has been asked for the money to buy adjoin land, and congressional action is sought. Until that time public buildings will inadequate for command and the officers will be obliged to live from 3 to 10 mi from hospital.

EFFICIENCY OF SANITARY TROOPS.

With the departure of 14 Regular medical officers to the mainland and elsewh last July and August, the organization of Ambulance Company No. 9 detaching t more from post and hospital duty, and the replacing these by one Regular and ei members of the Medical Reserve Corps, the Medical Department has been han capped in peace, and in case of actual hostilities would be greatly under its necess quota. This substitution of Medical Reserve Corps, some being elderly men w families, unfamiliar with their duties and Army methods, filling subordinate p tions under Regular officers their juniors in years and length of practice, is not c ducive to efficiency, and the surgeon of Schofield Barracks is laboring under spec difficulties in this particular.

Of the Regular officers it is unofficially stated that two contemplate resigning the near future to engage in civil practice. Of the eight Medical Reserve Corps (n January 20, 1917) it is understood that three will request early relief from act service. One has already asked for duty in Philippine Department, basing his ap cation on the grounds that the expenses in Hawaii are in excess of the salary of a f lieutenant. The present situation as regards quarters makes it very undesirable assign any married officer with less than captain's rank to duty at department h pital, as rent for suitable houses and necessary travel create expenses in excess the allowance for commutation.

STATUS OF SERGEANTS, FIRST CLASS.

he same applies to sergeants, first class, Medical Department, who, under the
nges in regulations reducing them from grade 13 to 15, are now deprived of com-
tation. This is a serious loss to a class of worthy noncommissioned officers from
om qualifications have been demanded equal to any of the noncommissioned staff.

ENLISTED PERSONNEL.

Vith the increased allowance of Medical Department enlisted personnel, the imme-
te urgent needs of the department hospital and Schofield Barracks are for the first
e supplied.

AMBULANCE COMPANY.

he organization of Ambulance Company No. 9 and the recent arrival of portion
ts motor transportation will enable future instruction in field service to be given
ll recruits of the Medical Department. While perhaps not absolutely necessary
case of hostilities here, at least one field hospital company should be given this
artment for instruction purposes.

he second ambulance company which the scheme of garrison contemplates should
organized at an early date, and unless a third company is available from the militia
hould be furnished by the Regular troops. While all the members of these sanitary
its may not be required in actual war for the express purposes for which organized,
services of trained men would be urgently needed in base and other hospitals
d could probably not be supplied from the mainland.

MEDICAL SUPPLY DEPOT.

he medical supply depot was established in April. The rented room is inadequate
proper storage and handling of all supplies and field reserves. Bids for new store-
uses have been advertised by the Quartermaster Corps, and it is understood that
e building is to be assigned to the Medical Department. Delay in receiving supplies
m the mainland due to strikes and congestion of freight has occurred. In view of
urrence of such conditions it is the part of wisdom to have on hand one year's
pply of nonperishable articles instead of six months. The supply officer has been
gaged in overhauling the reserve supplies and bringing them into an up-to-date
viceable condition.

PANAMA CANAL ZONE.

The mean strength of all troops, including officers, serving in t Panama Canal Zone during the year was 7,023, as compared wi 5,903 for 1915.

ADMISSION RATES.

The admission rate for all causes was 838.67, that for disea being 694.57, and that for external causes 144.10, as compared wi 859.22, 709.81, and 149.41, respectively, for the year 1915.

The diseases causing the highest admission rates were: Venere diseases, 115.62; malarial fevers, 66.50; bronchitis, 39.30; influen 38.59; diarrhea and enteritis, 30.90, and tonsolitis, 25.91.

It is considered worthy of comment to call attention to the remar able reduction in the malarial fever rate from 85.55 in 1915 to th given above, which would indicate that measures looking to the pr tection against and destruction of mosquitoes are effective, if pro erly carried out.

Admission rates for some of the principal diseases for Panama Canal Zone, Ameri troops, officers and enlisted men.

PORTO RICO.

The troops are all recruited from and partly officered by nati
Porto Ricans. The regiment is commanded by a United States Arm
officer. The sanitary work in connection with this organization is i
charge of a medical officer from the regular corps and a medic
officer from the Medical Reserve Corps. The two garrisoned pos
have a mean strength of 991 officers and men.

ADMISSION RATES.

The admission rate for all causes in 1916 (for officers and enlist
men) was 1,022.20, as compared with 552.16 in 1915; for diseas
942.48, as compared with 496.52, and for external causes, 79.72,
against 55.63 in 1915.

There is a marked increase in the total admission rate for 1916 ov
the year 1915, although the rate for venereal diseases is lower th
year as compared with 1915. The diseases causing the highe
admission as well as the highest noneffective rates were influen
and venereal, with rates of 250.25 and 80.73 per 1,000, respectivel

NONEFFECTIVE RATES.

The noneffective rate for all causes is also slightly higher than f
the preceding year, being 24.91 for 1916, as compared with 22.36 f
1915. The rate for disease was 22.53, as compared with 20.57 f
1915.

It will be noted that there was a marked increase in the malari
rate.

Some of the principal diseases, with the admission and noneffecti
rates, as compared with the preceding year, are shown in the followi
tabulation:

Admission and noneffective rates per 1,000 of mean strength for the most prevalent disea among officers and enlisted men in Porto Rico.

	Admission rates.		Noneffective rat	
	1916	1915	1916	191

Diseases of the lymphatic system	18.16	31.99	.83	[illegible]

NOTES.—For further report see Eastern Department.

DISCHARGES ON CERTIFICATE OF DISABILITY.

he rate for discharge for disability was 11.52 per 1,000 for diseases 1916, as compared with 7.34 for diseases in 1915.

DEATHS.

he death rate was 4.04 per 1,000, there being 4 deaths during the r, 3 due to disease and 1 to injury. In 1915 there were 2 deaths to disease.

CHINA.

The mean strength of all troops, including officers, serving in Chir during 1916 was 1,369. This force consisted of Infantry, a detac ment of Signal Corps, Hospital Corps, and noncommissioned sta all white.

ADMISSION RATES.

The admission rate for all causes was 874.36, that for disea 778.67, and that for external causes 95.69, which are all lower th for the year 1915. The diseases causing the highest admission a noneffective rates are shown in the following tabulations:

DISCHARGE ON CERTIFICATE OF DISABILITY.

he discharge rate for disability was 13.15 per 1,000 for all causes.

DEATHS.

he death rate was 10.23 per 1,000, the rate for disease being 4, and that for external causes 2.19. The death rate was higher n for 1915, being 4.35 for the latter year.

ables Nos. 3, 73, and 76 give all figures for the troops serving in na for the year 1916.

he rates would indicate that the general health conditions have htly improved during the year 1916, although not so marked ast year (1915) over 1914. A considerable decrease in the admis- rate for venereal diseases is noted, with an increase, however, in noneffective rate for the same disease.

ARMY TRANSPORTS.

The medical superintendent, Army Transport Service, port New York, reports as follows:

The transports listed below have been in service from port of New York for 19 with the following sailings:

U. S. transport *Kilpatrick*, between New York and Cristobal, Canal Zone.

U. S. transport *Sumner*, between New York and Cristobal, Canal Zone (also o trip was made touching at Kingston, Jamaica).

U. S. transport *Buford*, between New York and Iquique, Chile.

During this period no major infectious cases have been removed from any of t ships by national quarantine officers. A few cases of measles have been report among troops, but handled in the ordinary way.

Numerous troops have been transported in 1916, but no epidemics have aris either aboard or ashore in consequence and no infection has been conveyed fr distant ports.

Since October 11, 1916, a medical superintendent, appointed by S. O. 238, W. October 11, 1916, has had direct charge of inspections of these vessels at the ho port. The sanitary condition of the transports for 1916 has been satisfactory.

The department surgeon, Western Department, acting as medic superintendent, Army Transport Service, port of San Francisc reports as follows:

The sanitary condition of the Army transports and the accommodations provid for troops and passengers have been satisfactory.

During the voyage of the *Thomas* from San Francisco to Manila in February, 21 ca of mumps and 3 cases of measles developed. Original source of infection undoubtedly at Fort McDowell, Cal., from which post both mumps and meas were reported as having existed during the month of January, 1916.

Fifteen cases of measles developed between September 9 and October 4 on t U. S. transport *Sherman* en route to Manila and seven cases during the voyage endi at San Francisco, August 12, 1916.

The surgeon of the *Logan* reported that seven cases of measles among the childr of the first-class passengers occurred during the voyage from Manila to San Francis March 21 to April 19.

Weekly physical inspections of troops were held on all transpor Men found suffering from venereal diseases were placed under trea ment and denied shore leave while in port.

Under the direction of the medical superintendent, all perso embarking or disembarking were examined to determine wheth they had any infectious disease.

GENERAL HOSPITALS.

LETTERMAN GENERAL HOSPITAL, SAN FRANCISCO, CAL.

he location of this hospital on the Presidio military reservation ermanently fixed by the amount of money already invested.

he small amount of land assigned to the reservation for the hos- l is entirely occupied by buildings, and it can not be further ex- ded without the allotment of additional land to its reservation. s can be done without taking any of the land necessary for troops ioned on the Presidio reservation. The small plat of land on the nsion of the present line of the hospital reservation, south of Fine Arts Palace, could be used, and immediate action should be en to secure the assignment of this small plat of land to the terman General Hospital reservation, as to-day, if an emergency se, there isn't any land within the limits of the present reserva- n on which a half dozen tents could be pitched.

he climate is bracing and invigorating, never very hot and never y cold, and it is particularly fine for the purposes of a general pital. The patients returning here from the Tropics recuperate idly, and their vitality is restored probably much sooner here n in any other section of the country.

uring the year the following new buildings were completed: rd A; a reinforced concrete building; addition to the bacterio- cal laboratory; last unit, nurses' dormitory medical and surgical ensary.

he number of patients admitted during the year was 2,972. re were 334 cases remaining from the previous year; 2,941 cases e disposed of during the year. In addition to the above, there e 111 admissions from the Federal National Guard; of these 95 e disposed of, and 16 were remaining in hospital on December 31, 6. The number of cases treated during the year was 3,383, as ows: Medical, 1,650; surgical, 1,158; venereal, 315; and mental, . The average number of days lost for each case was as follows:

	Officers.	Enlisted men.	General prisoners.	Civilians.	
				Male.	Female.

Nine hundred and twenty-four operations were performed, against 771 last year (the eye, ear, nose, and throat cases included), an increase of 153. In addition and not listed in the ab statement, there were 7,435 dressings done and 48 emergency c attended to in the dressing room of the operating pavilion, 9,569 dressings were done in the dressing room of the surgical w for infected cases and 171 minor operations performed.

SURGICAL SERVICE.

Gynecology and obstetrics.—The appended report of operations the tabular statement give in detail the number and characte gynecological operations performed and treated. The facilities caring for these cases are satisfactory and sufficient, though at ti the ward has been uncomfortably crowded.

In July the ward for special surgical cases was opened and use an obstetrical ward, a needed addition, and well meets the requ ments as an obstetrical ward.

There was a total of 57 confinements cared for during the year, divided as follows:

Normal deliveries	53
Breech presentations	[illegible]
High forceps, axistraction	1
Midwifery forceps	[illegible]
Total	57

There was one stillbirth, due to prolapse of cord in high forceps delivery, the labor very prolonged. One baby died within a week after birth through failure of the foramen ovale to close. There was one death in puerperium from the complication of double l pneumonia. There were six miscarriages and abortions, and premature birth.

In all cases of perineal laceration immediate repair was done.

A total of 418 patients were admitted to the woman's ward during te year, an increase of 36 over the admissions of last year.

Venereal wards.—Venereal cases admitted and treated amounted a total of 373 during the year, divided as follows:

philis:	
Primary	17
Secondary	66
Tertiary	50
Period undetermined	34
Hereditary	1
Acquired nonvenereally	1
docyclitis, syphilitic	1
Syphilis, all periods, total	170

Of this total, 108 were returned to duty, 29 were discharged on rtificate of disability, 13 left hospital, 1 deserted, 2 died, and there e 17 remaining.

ancroids	32
ibo, chancroidal	12
imosis, chancroidal	1
Chancroids and complications, total	45

Of these 42 were returned to duty, 1 was discharged on certificate disability, 1 deserted, and 1 is remaining.

norrhea:	
Urethritis, acute	70
Urethritis, subacute	16
Urethritis, chronic	28
Arthritis	20
Epididymitis	14
Prostatitis	3
Urethral stricture	4
Cystitis	1
Endocarditis	2
Gonorrhea and complications, total	158

Of the above, 116 were returned to duty, 24 were discharged on rtificate of disability, 7 left hospital, 1 died, and 10 are remaining der treatment.

Of all the venereal cases, 128 existed prior to enlistment, and at e end of the year there is a total of 28 remaining under treatment.

Orthopedic work was discontinued in July of this year, the officer ho was in charge of it having been ordered away. Considerable ccess attended this line of work, and many cases were saved to e service which otherwise would have had to be discharged.

The following is a statement of the work done in the eye, e nose, and throat clinic:

SUMMARY.	Hospital cases.						Out cases.						
	Officers.	Enlisted men.	Families, officers and enlisted men.	Civilian employees.	Civilians.	Total.	Officers.	Enlisted men.	Families, officers and enlisted men.	Civilian employees.	Army Nurse Corps.	Civilians.	Total.
Total eye cases	52	213	20	2	9	296	105	201	270	13	25	49	663
Total ear cases	26	144	18	4	3	195	18	59	91	8	19	12	207
Total nose cases	50	215	20	9	4	298	32	82	89	11	10	5	229
Total throat cases	34	231	129	14	3	411	26	40	271	12	8	4	361
Total, all cases	162	803	187	29	19	1,200	181	380	521	44	52	70	1,460

There were 2,660 cases treated, and 519 operations perform during the year.

There were 446 cases of all classes refracted.

The dentist on duty at the hospital reports 1,717 persons treat in the dental clinic during the year.

The work of the laboratory has increased 50 per cent over that the preceding year. This laboratory, in addition to performing large amount of work required for this hospital, does the work of Western Department and for posts not in that department located in the western part of the United States. The report of work done will be found under the general head of "Laboratorie

The mean daily strength of the personnel on duty during the y was as follows:

Medical officers	13
Post noncommissioned staff	2
Detachment, Medical Department and Quartermaster Corps	140
Nurse Corps	42
Mean aggregate	198

There were 27 civilians employed by the Medical Department, a 11 by the Quartermaster Corps on duty in the hospital during year.

The enlisted personnel at this hospital is inadequate. The stren has been increased somewhat, but it is still too meager to render service required. It is recommended that it be increased to the allowance provided for general hospitals, as per Manual for Medical Department, 1916.

On December 31, 1916, there were 393 patients in hospital, wit total enlisted strength of but 151.

The mean strength of enlisted personnel for the year was 140.72

Army Nurse Corps.—The work of the Army Nurse Corps on d at this hospital has been of a high order, and at times very arduo due to its inadequate number. The fluctuation of patients in hospital, and sudden call for nurses for isolation, made a great dr on the number on duty in the wards.

There has been an average of 42 nurses on the roster at this hospital ring the year; but this does not mean that this was the average of rses doing actual duty, as it included nurses coming from the ands with leaves of absence granted them, those here for a short ne before sailing for the islands, and those on actual assignment re on leave and on sick report.

There are always a number of seriously sick patients here to be red for, and, in order to give them this care and to allow for leaves d sickness, the number of nurses assigned to this hospital should t be less than 55.

A new X-ray laboratory, with modern X-ray equipment, com-ensurate with the size and importance of this institution, is sential.

The following designated new buildings were completed during the lendar year 1916:

nuary 22, 1916.—Ward A, a reinforced concrete building	$19,678.00
bruary 10, 1916.—Addition to the bacteriological laboratory	5,264.10
ly 28, 1916.—Last unit, nurses' dormitory	18,653.00
cember 22, 1916.—Medical and surgical dispensary	19,806.50

MEDICAL SERVICE.

During the past year there have been no new features on the edical service worthy of mention from the standpoint of diagnosis d treatment.

A new ward designed especially for the open-air treatment of berculosis patients was completed and opened during the year. his ward is devoted to the care of patients awaiting transfer to ort Bayard, N. Mex., and of other tuberculosis patients who can not so transferred for various reasons.

There were no new features introduced in the X-ray laboratory uring the year.

One thousand and forty-one Roentgenograms were made during e year; this number included the examination of 63 gastrointestinal ses after bismuth meals, and also 135 dental cases.

The construction of a new X-ray laboratory commensurate with e size and importance of this hospital, with modern equipment, cluding a larger X-ray machine installed on an alternating current, ould greatly increase the scope of this work.

During the year there has been a daily average of about 26 cases ceiving treatment in the new hydrotherapeutic plant. In the small lant operated in the officers' ward about six cases received hydro-erapeutic treatment daily.

One case of typhoid fever was admitted to the hospital during e year. This patient had received two doses of typhoid prophy-xis, the second one three days before he was taken ill. He made n uninterruptd recovery. No cases of paratyphoid fever were dmitted during the year.

One case of cerebrospinal meningitis, epidemic form, was admitted the hospital during the year. He was treated with antimeningitis rum and made a good recovery. It was, however, necessary to ischarge him on certificate of disability for neuritis, a sequel of the isease.

Three cases of trichinosis were admitted. They all recovered after rather prolonged convalescence.

A civilian employee of the Quartermaster Department was admitt to the hospital during the year, suffering from leprosy. He w transferred to the isolation hospital, San Francisco, Cal.

First Lieut. H. R. Oliver, Medical Corps, has been in charge the laboratories for chemical and pathological work since Octob 19, 1916. Capt. H. J. Nichols, Medical Corps, was chief of the labor tory service from January 1, 1916, to July 25, 1916, when he w ordered to the Southern Department for temporary duty. Duri the rest of the year the work was under the direction of Lieut. H. Oliver, Medical Reserve Corps, assistant clinical professor of me cine, of medical department of Stanford University. Sergt. Au burg, Medical Department, who had been in the laboratory as n commissioned officer in charge, was relieved February 12, 1916, Sergt. Williams. The present force is one sergeant and four privat fisrt class, and privates.

The laboratories served as clinical laboratories for the hospi with its 3,078 admissions, and as a department laboratory for t Western Department. The work covers parts of chemistry, bacte ology, parasitology, pathology, and serology, and may be summariz as follows:

Urine examinations	5,767	Typhoid examinations:	
Sputum examination for tubercle bacilli	1,077	Blood	
Throat cultures for diphtheria	810	Stool	
Blood examinations	895	Urine	
Examination of feces for parasites and ova	744	Agglutinations	
Examination of venereal sores and discharges	401	Renal functional tests	
Spinal fluid examinations	181	Animal inoculations	
Wassermann reactions	7,984	Water examinations:	
Skin reactions	39	Chemical	
Smears, miscellaneous	1,112	Bacteriological	
Stomach contents, routine	58	Milk examinations:	
Stomach contents, toxicological	4	Chemical	
String tests for occult blood	16	Bacteriological	
Skin examination	7	Examination of human milk	
Cultures, miscellaneous	268	Examination of rats and gophers for plague	
Vaccines made	42	Miscellaneous chemical examinations—drugs, flour, etc.	
Vaccines and injections	487	Tissue examinations	

Autopsies.—Under orders of the commanding officer, post-mort examinations were made on all officers and enlisted men dying this hospital and permission was obtained for examination of so of the other cases. Of the 83 deaths, 53, or about 63 per cent, w followed by autopsies. In general, about 90 per cent of the clini diagnoses were confirmed at autopsy.

Syphilis.—The most interesting development under this head has been the marked increase in the number of Wassermann re tions performed during the year. This item shows an increase more than 150 per cent over the preceding year, due to the rout examination, since January 1, 1916, of 2,834 recruits from F McDowell, Cal., and since July 14, 1916, of 1,342 recruits from F Logan, Colo.

'he following table gives a brief summary of the Wassermann :tions during the year:

	Total.	(+)	(±)	(+ −)	(−)	Anticomplementary Hæmolyzed, etc
it depot, Fort Logan, Colo	1,342	92	27	31	1,166	26
ent		6.85+	2.01+	2.31+	86.[illegible]+	1.93+
uit depot, Fort McDowell, Cal	2,831	199	70	85	2,478	2
ent		7.02+	2.47+	2.99+	87.[illegible]3+	.07+
her posts in Western Department	3,808	907	181	214	2,478	25
ent		23.82+	4.83+	5.62	65.07+	.65+
Total	7,981	1,198	281	330	6,122	53
Per cent		15.00+	3.52+	4.13+	76.67+	.66+

'he value of the practice of making and recording routine Wasser-nn tests on recruits has been repeatedly deomonstrated at this pital within a few months of enlistment. It is believed that this ue will increase with years of service, and that the Wassermann should become a recognized part of the examination of recruits. serum test for tuberculosis recently investigated by Maj. Craig ld also be made with the same specimen of blood.

'yphoid group.—Two cases were diagnosed typhoid fever during year. One case, a private in the Coast Artillery Corps stationed Fort Winfield Scott, Cal., was admitted to this hospital March 11, 6, and positive blood cultures were obtained on March 16, 1916. had completed his typhoid prophylaxis on March 1, 1915. The rce of infection could not be traced, but was probably in the city San Francisco. No other cases developed at that post.

'he second case was a private in the Second Infantry, Washington tional Guard, serving at Calexico, Cal. A positive blood culture obtained July 24, 1916, in this laboratory and the patient was sequently transferred to this hospital for treatment. He had eived but two doses of typhoid prophylaxis; the second dose, en July 5, 1916, and he was taken sick on July 8, 1916.

'o cases of paratyphoid were admitted.

)iphtheria.—Further experience confirms the opinion that medical cers, enlisted men of the Medical Department, and nurses should subjected to the Schick test before taking charge of diphtheria es, and that, if possible, this test should be carried out on contacts ore using prophylactic doses of serum.

n several instances, virulence tests were made on organisms from riers, and when the tests were negative the carriers were released m quarantine or observation.

Rabies.—Two cases which had been bitten by a rabid dog were ated with the Pasteur treatment, one receiving the intensive atment and the other the modified treatment; neither case devel-d symptoms. The brain of the dog was received and Negri bodies nonstrated in this laboratory.

Water supply.—The water supply of this reservation has given ich concern to those responsible for its purity on account of the inge—accidental contamination—of the watershed from the city eets and sewers. The alum-sand filter is efficient ordinarily but er a break of a city sewer into Lobos Creek in January, 1916, the

filter proved unable to purify the water and boiling was necessar
This was quite a serious matter, as it involved the water supply
Fort Scott, the Presidio, the Letterman General Hospital, Fo
Mason, Fort McDowell, and the transports. After considerab
agitation a chloric gas outfit was secured, with the assistance of Ma
W. J. L. Lyster, and installed in September, 1916. The machin
has proved quite satisfactory and two parts per million has mac
it possible to reduce the amount of alum used about one-half. E
periments are in progress to determine if it is safe to reduce the alu
further or entirely give it up, using simply the sand filter to remo
gross dirt. The price of alum has gone up about 300 per cent.

Amount of work and needs.—The work done, in general, exceeds th
of the preceding year by over 50 per cent, some few branches of th
work, such as Wassermann tests, showing a much larger increas
This increase has been accommodated notwithstanding the fact th
since July the laboratory has not at any one time had its full quo
of enlisted personnel, and at times running with as low as 50 per ce
of the number at work the year preceding. The greatest need
present is for a competent chemical assistant to replace the priva
whose services the laboratory lost the latter part of November.

Gas was installed in the laboratory about the middle of July, 191
and has proved a great aid and timesaver.

Special work.—A lecture on "Spirochetiases" was gvien at th
Hooper Institute, University of California, on March 4, 1916, by Cap
Nichols.

A paper on "Possible Reasons for Lack of Protection after An
typhoid Vaccination," by Capt. Nichols, was published in the Mi
tary Surgeon of March, 1916.

In line with the policy of the Surgeon General's Office to establi
research boards in connection with the larger laboratories, some wo
was undertaken by Capt. Nichols on the gall bladder carrier proble
The results of this investigation were published in a paper entitl
"Experimental Observations on the Pathogenisis of Gall Bladd
Infections in Typhoid, Cholera, and Dysentery," which appear
in the Journal of Experimental Medicine for November, 1916.

WALTER REED GENERAL HOSPITAL, TAKOMA PARK, D. C.

This hospital serves as the general hospital for the Eastern Unit
States and as the post hospital for Washington Barracks.

It is situated at Takoma Park, D. C., about 6 miles from the W
Department and three-quarters of a mile from the Baltimore & Oh
Railroad stations at Takoma Park, D. C., and Silver Spring, Md.

The present capacity of the hospital, including the baseme
wards, is about 180 beds. In addition there are 17 beds in t
isolation ward, and arrangements have been made by which 1
additional patients may be cared for, temporarily, in the detachme
barracks.

The average number of days in hospital for patients has increas
over 23 per cent during the year, the increase for officers and enlist
men amounting to 20 per cent.

The accommodations for officers and women, and others on t
status of officers, are inadequate and some discomfort and d

isfaction has resulted from frequent shifting of patients to provide ce for the different sexes, ages, and conditions.

The commanding officer recommends that wards "A" and "B" made three stories each, thereby providing additional rooms for cial cases.

Additional room is also needed for the X-ray laboratory. During year 729 cases were X-rayed, of which number 108 were taken or more times for comparison, and 53 were dental cases.

The group of rooms for psychopathic patients was completed and t into use during the year, but has not proved satisfactory.

Although there are 11 medical officers on duty at this hospital, y two are provided with quarters in the grounds, an arrangement ich is unsatisfactory and impairs the efficiency of the hospital vice.

At least two double sets of married officers' quarters should be ovided.

With the exception of necessary minor repairs the hospital and st of the other buildings are in good condition.

The stables should have concrete floors, and arrangements should made for the disposal of manure without fly breeding.

The temporary coal sheds which were erected some years ago are sightly and falling down; they should be replaced by permanent uctures.

A shelter for the protection of persons waiting for the cars, often uarter of an hour at a time, should be provided, which could well constructed so as to combine a waiting pavilion with a proper d dignified entrance to the grounds in the shape of an ornamental h with gateways.

The grounds require grading, filling, and the surface drained.

The service of the hospital would be much improved by a more rmanent staff, medical officers, enlisted men, and nurses.

A dental surgeon, whose services are greatly in demand at this spital, has recently been assigned to duty and will no doubt be a ry useful addition to the staff.

The character of recruits received during the year has been below normal. Many are very young and irresponsible, others are hard nkers, and quite a few seem incorrigible.

The allowance of men of the Quartermaster Corps is insufficient, cessitating the detail of at least six enlisted men of the Medical partment for duties that should properly be performed by the artermaster Corps personnel.

The number of patients admitted during the year, including ilians, was 1,350, an increase of 175 over the preceding year.

The average number of days in hospital for each case was as follows:

Class of cases.	Officers.	Enlisted men.	Civilian.	
			Males.	Females.
lical	34.48	29.13	31.86	24.09
gical	29.00	35.93	16.67	16.38
ereal	53.00	31.49	42.00	....
tal	22.40	32.57	32.25	19.25

The following table shows the movement of the sick, together wi the principal sources of admission, during the calendar year 1916, i cluding civilians. No general prisoners were admitted.

	Officers and enlisted men.	Officers and enlisted men, Organized Militia.	Civilians.	Total.
Admissions:				
Command	144		11	
Transfer	602	29	6	
Otherwise	115	12	431

Dispositions:				
Duty	607	25	7	
Died	25		19	
Discharged for disability	110			
Deserted	1			
Discharged, expiration of term				
Transferred to Government Hospital for Insane	27	2	2	
Transferred to Fort Bayard, N. Mex	7			
Transferred to other hospitals				
Otherwise disposed of	91	10	414	
Remaining Dec. 31, 1916	78	4	27	
Total	946	41	469	1,

There were 44 deaths. Of this number 7 were officers, 18 enlist men, 5 retired officers, 4 retired soldiers, and 10 civilians.

The following were the causes of deaths:

Cellulitis	1
Diabetes, mellitus	3
Sarcoma	3
Carcinoma of uterus	1
Carcinoma of stomach	2
Tumor of pancreas	1
Tumor hypernephroma	1
Tumor malignant of prostate	1
General arterioschlerosis	3
Chronic interstitial nephritis uremia	2
Fracture, base of skull, meningitis	1
Fracture of skull	1
Pulmonary tuberculosis	1
Injury of skull or brain	1
Paralysis of intestines	1
Tabes dorsalis, syphilitic	1
Cerebrospinal and pulmonary syphilis, meningeal irritation	1
Gunshot wound, self-inflicted	1
Drank solution of lye (insane)	1
Hanging by neck, depressive mania	1

Pneumonia, lobar
Myocarditis, acute dilatation and hepatitis, chronic, syphilitic
Influenza, acute
Cerebrospinal meningitis
Pernicious anemia, with edema of lungs
Strangulated inguinal hernia
Hypertrophy of prostate, with urinary retention
Typhoid fever, acute cardiac dilatation
Pylephlebitis and peritonitis
Suppression of urine and uremia
Softening right cerebral hemisphere
Nephritis, subacute, with toxemia
Aortitis, acute
Gastric obstruction following perforation of gastric ulcer
Appendicitis, acute, suppurative

There were 110 discharged on surgeon's certificate of disabilit Of this number 47 were in line of duty, 61 were not in line of dut and two cases were discharged for two separate disabilities, one line of duty and one not in line of duty.

The causes were as follows:

GENERAL HOSPITAL, FORT BAYARD, N. MEX.

he general hospital at Fort Bayard is devoted to the treatment ulmonary tuberculosis in officers and enlisted men of the Army in beneficiaries of the soldiers' home.

ort Bayard is situated in Grant County, N. Mex., in the extreme thwestern part of the State. On account of the southern loca- n of the hospital, it is generally assumed by those unfamiliar with local conditions that the climate is very warm; but the altitude, 65 feet, largely counterbalances the influence of the southern sun and renders the climate cool rather than warm. The usual viciss tudes of the seasons are experienced. In the winter there is occ sional snow; frosts occur nearly every night; rarely there is seve cold approaching the temperature of zero Fahrenheit, but such col is of brief duration. On the whole the winters are relatively warn dry, and clear. In the summer the heat is tempered by the dryne of the air, with the resulting diathermancy. The fact that summ is the time of the chief precipitation also exercises an importa effect upon the temperature, clouds and rain very frequently bei present during what would otherwise be the hottest portion of th days. These factors result in producing singularly cool weathe the summer being far more comfortable for the human organis whatever the thermometer readings, than that of the greater pa of the Northern States of the East and of the Mississippi Valle For the treatment of tuberculosis the peculiar excellence of th climate of Fort Bayard consists in the fact that it is one that avoi harmful extremes of temperature, yet in its diurnal and annu variations affords a sufficient stimulus to the human organism favor activity of the metabolic processes.

It is desired to invite especial attention to the need of increas accommodations for enlisted patients. The capacity of the enliste men's infirmary has been heretofore given as 66 beds. (See annu report for 1912.) If the estimation of the capacity of the hospit be made in the usual way, that is, to include only the beds availab in wards and rooms (not including a certain number of beds plac upon the porches), the capacity of the enlisted men's infirmary only 137 beds. Similarly, the capacity of Annex No. 1 of the inf mary, rated at 55 beds, is only 28 beds if beds in porches be exclud from consideration. Annex No. 2, occupied for the first time duri the last calendar year, is considered to have a capacity of 40 bed Counting only the bed space available within the two wards of th building we have a total of only 24 beds. The infirmary with i annexes is supposed to have a capacity of 161 beds and actual accommodated 140 patients on December 31, 1916. Yet if eve patient had been adequately protected against the inclemency of t winter weather the number would have been only 89. Under t present arrangement a certain number of patients are necessari subjected to discomfort if not actually dangerous exposure duri the occasional storms of winter. There can be no question th adequate housing should be provided for this class of patients whi includes the most serious cases, so that each patient who is lodg habitually upon one of the porches can also have a bed within t building in which in case of need he can take refuge. Such provisi is now made for the patients quartered in the officers' and wome infirmaries.

Paragraph 334, Manual for the Medical Department, 1916, pr vides that no cases of surgical tuberculosis should be sent to Fo Bayard unless the condition of the patient is such that benefit m be expected from hygienic treatment in which outdoor life plays prominent part or, in other words, unless the patient is not stric confined to his bed by the nature of his disease. This provision w framed partly with the idea that patients so ill with surgical tuberc losis as to be unable to leave their beds within the wards would re but little advantage from the climatic treatment as practiced at t hospital. But another consideration was also taken into accou nely, that the scanty and ill-arranged space devoted to surgical es in the present infirmary might easily be overtaxed if the number this class of patients were not strictly limited by exclusion of ients incapable of locomotion. Surgical tuberculosis is, however, uliarly amenable to heliotherapy, a mode of treatment for which sunny and cool climate of New Mexico is especially adapted. ses of surgical tuberculosis, therefore, need and should have wards this institution so arranged that beds could easily be moved ween the wards and porches so that even the sickest patients ght receive the benefits of the sun baths.

t would seem that this institution has now passed beyond the perimental stage and that adequate provision should at once be de for the proper accommodation of its patients. That a new l enlarged infirmary is urgently needed is sufficiently apparent m the facts just cited and the need is seen to be the greater if reflects that the proposed and partly effected increase in the of the Army will necessarily in time lead to a considerable rease in the number of patients at this hospital. The recommendation heretofore repeatedly made is therefore renewed that mediate steps be taken with a view to securing the necessary propriation for a new building.

The number of patients admitted during the year, including neficiaries of the soldiers' home and civilians, was 778, being an rease of 40 over the preceding year. The average number of days hospital for each case was as follows:

	Officers.	Cadets.	Enlisted men.	Beneficiaries of soldiers' home.	Civilians.	
					Male.	Female.
ical	112.2	295.76	102.58	132.80	112.11	118.79

---

[1] Does not include one civilian, not on sick report, who died at the post.

Fourteen cases were admitted for suspected pulmonary tuber losis in which the diagnosis was not confirmed. Two cases were un treatment for tuberculosis in which the lungs were apparently involved. Two cases died en route to this hospital and are included in the above table. Of the cases classed as tuberculosis, were returned to duty. One case was returned to duty in 1916 has since been readmitted. Still another case has been twice turned to this hospital for treatment for tuberculosis, although diagnosis of pulmonary tuberculosis has never been indisputa established. The number of cases under treatment on December 1915, was 363. The number of cases under treatment on Decem 31, 1916, was 372. The total number of cases treated during the y was 1,141, of which 798 were cases of tuberculosis.

The causes and number of deaths which occurred at this hosp during the year are shown in the following tabulation:

Fracture of skull	1	Chronic pulmonary tuberculosis	
Lobar pneumonia	1	Tuberculosis meningitis	
Tuberculosis peritonitis	2	Pernicious anaemia	
Acute cardiac dilatation	3	Acute fatty degeneration of the liver	
Gunshot wound of the heart	1	Traumatic hemo-pneumothorax incident to gunshot wound of chest, etc	
Pyogenic infiltration and gangrene, both lungs	1	Acute congestion of lungs	
Sclerosis of coronary arteries	1		
Cerebro-spinal meningitis	1		

There were 74 deaths in all, of which number 2 were officers, enlisted men, 33 beneficiaries of the soldiers' home, and 12 civili

The above table includes 1 case of pulmonary tuberculosis (civili not on sick report; 1 case of fracture of skull (civilian), who die the vicinity of the hospital; 1 case of acute cardiac dilatation (soldi who died en route to this hospital; and 1 case of pulmonary tu culosis (soldier), who died en route to this hospital.

There were 179 patients discharged on certificate of disabil The causes were as follows:

Pulmonary tuberculosis	
Chronic pleurisy	
Hernia, inguinal, recurrent	
Diabetes	
Total	

The following is a condensed statement of the surgical operat performed at this hospital during the year:

he above tabular statement includes 10 cases of artificial pneumo- rax, not included in the report of surgical operations (Table . 66).

he treatment of pulmonary tuberculosis by artificial pneumo- rax has been employed at this hospital since January 12, 1913. ty-nine patients have been submitted to this treatment; of these, were cases of pulmonary tuberculosis and one of bronchiectasis. 40 cases the compression was successful; 9 could not be com- ssed on account of pleural adhesions. As to results, 23 cases re had their disease arrested and are in good health, as far as own; of these, 18 cases have left the hospital: 7 cases had exten- ıs in the healthier lung and treatment had to be discontinued; 5 d; and 2 left the hospital. Two cases died shortly after compres- n, of heart failure. In the case of bronchiectasis the treatment l to be discontinued on account of dysopnoea. Five cases left the pital soon after compression. Twenty of the above cases had ural exudate as a result of the infection of pneumothorax. Of se, 2 developed empyema. In 1 of the cases a Schede opera- n was performed with the result of complete recovery.

he following is a statement of the hospital laboratory work done ing the year:

minations of—		Wassermann tests	312
Sputum	9,474	Human autopsies	65
Blood	212	Histopathological sections of human tissues	892
Pleural exudates	17	Miscellaneous examinations	71
Urine	1,014		
Feces	21		
Gastric contents	11		

n addition to the above, considerable experimental and research rk on complement-fixation and other subjects connected with erculosis has been done.

he number of completed cases of pulmonary tuberculosis in 1916 s 474. Important complications were present as follows:

erculous laryngitis	59	Tuberculous spondylitis	2
hilis	33	Pulmonary abscess	1
phinism	3	Pulmonary osteoarthropathy	1
onic tuberculous otitis media	17	Aneurysm of arch of aorta	1
hritis	3	Mitral regurgitation	1
riosclerosis	2	Fecal fistula	1
pyema	3	Epilepsy	1
arial fever	4	Bronchial asthma	1
erculous enteritis	11	Tuberculous meningitis	1
erculous arthritis	4	Tuberculous prostatitis	1
erculous fistula in ano	13	Manic depressive psychosis	1
ntaneous pneumothorax	2	Tuberculous pyopneumothorax	1
erculous peritonitis	2	Chronic frontal suppurative sinusitis	1
urisy with effusion	8	Tuberculous neuritis	1
aract	2	Bronchiectasis	1

The result of treatment in completed cases[1] of pulmonary tub culosis was as follows:

Class.	Number.	Apparently cured.		Arrested.		Apparently arrested.		Quiescent.		Improved.		Unimproved.		Die
		Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.

ARMY AND NAVY GENERAL HOSPITAL, HOT SPRINGS, ARK.

Although this hospital was originally intended for the treatn especially of diseases in which hydrotherapy is indicated, becaus the need for the evacuation of the sick from the base hospitals in Southern Department to avoid any congestion, it has served in as a general hospital for both the Southern and Central Departm Paragraph 1441, Army Regulations, 1913, provides that—

> The Army and Navy General Hospital, Hot Springs, Ark., is under the dir of the Secretary of War, and is devoted to the treatment of the officers and en men of the military and naval service of the United States, cadets at the United Military and Naval Academies, officers of the Revenue-Cutter (now Coast G

---

[1] By "completed cases" are meant all cases which have terminated their connection with the h in any way.

vice, officers of the Public Health Service, and honorably discharged soldiers and ors of the Regular and Volunteer Army and Navy of the United States, for such ases as the waters of the Hot Springs of Arkansas have an established reputation benefiting.

During the year the following improvements and additions were de:

Porches and plumbing which had been omitted in the construction Hospital Corps barracks.

The ward additions of 1915, the Hospital Corps barracks, and a set noncommissioned officers' quarters were inclosed with screening. New plumbing was installed in the douche room of the old officers' hhouse, the tile floor relaid, and a new wall control, sitz, shower, dle, and perineal douche fixtures were added, making a third nplete hydrotherapeutic room.

A one-story porch was erected over the kitchen door of the Nurse rps dormitory.

The porches of all the ward buildings were inclosed with sash and nings provided which gives sufficient protected spaces for 133 litional beds for patients, bringing the present bed capacity of the spital up to 322.

There were no additional buildings constructed during the year.

The total number of admissions during the period covered by this ort was 817, a decrease of 43 from the preceding year. Of the mber of admissions to sick report, 28 were officers of the Regular my, 3 were officers of the National Guard, 6 retired officers, 198 isted men of the Regular Army, 113 enlisted men of the National ard, 22 retired enlisted men, and 447 civilians, which include norably discharged soldiers and sailors of the Army, Navy, Marine rps, civilian employees, and Army Nurse Corps. The daily average mber of patients treated in hospital was 105.63.

The following tables show the principal causes of admission and the thod of disposition of all cases:

Mean aggregate	8

DEPARTMENT HOSPITAL, MANILA, P. I.

This hospital is the general hospital for the Philippine Departm It differs from the general hospitals in the United States in that i not directly under the control of the Surgeon General, but owing its geographic location it is under the authority of the departm commander. It is situated on the corner of Calle Arroceros and C Concepcion on a plot covering about 4 acres, adjoining the med supply depot. It consists of 30 separate buildings used for the lowing purposes: Receiving office, quarters for the officer of the d administration building; eye, ear, nose, and throat clinic and X- department; isolation ward, officers; women, obstetric and operat rooms; five buildings for wards for enlisted men; tailor shop, ni men's and cooks' quarters; post exchange; library and barber sh general and noncommissioned officers' mess and supply rooms; is tion cells; carpenter shop; morgue; quartermaster's storeroom corral together. The nurses are quartered in a long frame build on Calle Concepcion and are very comfortably fixed. There is set of officers' quarters on the reservation, and it has been custom to assign it to the obstetrician. The buildings are of the old Spa type, long, one-story, running out from a central patio or court. T require constant repairs of more or less extent to keep them i serviceable condition. The plumbing and wiring throughout hospital are old and obsolete in design, although the former has b

owed in the ward toilets during the year. There can still be con-
crable improvement in the lighting system. All the steam, gas,
hot-water pipes are above ground, running just under the eaves
he porches; they are readily accessible for repairs but very un-
tly. All buildings are well screened. The sewerage is surface,
outlet into the Pasig River. At high tide and heavy rains or
ds the water backs up and floods the grounds.

uring the year an artesian plant has been completed, consisting
well bored to about 780 feet to a stratum of very potable water;
oncrete structure over the well, housing an electrical pump, with
),000-gallon tank for storage. This water is slightly above the
pted standard of hardness, but has a very low bacterial count
no gas producers, and has replaced the distilled water formerly
l in large quantities.

he sterilizing and water-heating plant of the operating room has
n placed in a separate room. It is now housed in a concrete, tiled,
well-ventilated addition to the operating and anesthetizing rooms.
s change has added much to the comfort of those on duty, as the
ner arrangement caused an almost unbearable heat when the ster-
rs were in operation, and has also facilitated the handling of the
ruments, etc., by the nurses. A new battery of steam and hot-
er heaters has also been installed in this department.

uring the year the installation of gas throughout the hospital to
ace the steam appliances for sterilizing purposes was started, and
December 31 a steam boiler and a hot-water heater using gas as a
were erected and in working order, supplying steam for the
hen of the general mess and hot water for the entire hospital.
h sterilizing apparatus throughout the hospital, in the wards,
rating room, and laboratory, has been equipped with a gas burner;
have been thoroughly tested and found satisfactory in operation,
gh requiring somewhat more care to avoid injury to apparatus
the former method of supplying steam from a central plant.

as stoves for the general mess, sick officers' mess, and nurses' mess
e been ordered from the States. When these are installed the
re steam and heating system of the hospital will be using gas.

he substitution of artesian for distilled water and of gas as fuel
permitted the closing of a steam and distilling plant running three
orsepower boilers. The latter are in bad condition and would
e had to be replaced if the old system were continued. As now
nged each apparatus is always ready for use and can be operated
pendently of the others. The use of gas instead of coal is not
more convenient and cleanly, but will undoubtedly be more
omical as well. The local gas corporation is at present enlarging
lant and promises a sufficient supply of gas.

he old motor ambulance, Keeton make, has been condemned and
late-model White cars procured. The orderly has been mounted
motorcycle. A motor truck for heavy hauling to replace the
ent escort wagon, a light truck of the Ford model for market pur-
s, and a roadster of the same model to take the place of the
herty wagon are urgently needed to motorize the transporation
e hospital and increase its efficiency, and will greatly economize
e maintaining of this department.

The climate is tropical, with a rainy season starting about Jul with typhoons of more or less severity. The rains last general through November. The months of December, January, and Fe ruary are very comfortable; a little warm during the day, wi delightfully cool nights. It begins to get warm in March, and Ap May, and June are hot and dry. There is very little malaria, b some dengue, sporadically and in small epidemics.

The following table shows the movement of the sick, together wi the principal souces of admissions, during the calendar year 19 civilians and Philippine Scouts being included:

	Officers and enlisted men.	Philippine Scouts.	Civilians.

perations of eye and ear clinic are shown above to complete the le, although it is a separate service. There were 74 deliveries at m in the obstetrical ward, with 2 stillbirths and 1 maternal death.

The following is a list of major operations requiring a genera anesthetic, and not otherwise accounted for:

Cholecystostomy	
Circumcision	
Drainage of urinary abscess	
Epididymotomy	
Extirpation of fistulous tracts	
Incision and drainage of abscesses	
Ligation and excision (hemorrhoids)	1
Ligation and excision (variocele)	
Ligation and excision (varicose veins)	
Opening of dento-alveolar abscess	
Posterior urethrotomy	
Total	

There were 8 minor operations for circumcision, requiring a loca anesthetic, and not otherwise accounted for.

List of dressings for the calendar year ending Dec. 31, 1916:

Officers	1,8
Enlisted men	5,4
Civilians	6,7
Total	14,0

The following is a report of the hospital laboratory work don during the year:

Examination of—		Examination of—	
Blood	5,862	Feces	3,2
Urine	3,402	Smears and cultures	1,1
Sputum	1,884	Water examinations, bacteriological	5
Pathological sections	158	Chemical, biological, and miscellaneous	6
Animal injections	144		
Wassermann reactions	4,739		

The mean strength of the personnel on duty at this hospital for th year was as follows: Medical officers, 8; dental surgeons, 2; Arm Nurse Corps, 24.03.

DEPARTMENT HOSPITAL, HONOLULU, HAWAII.

he department hospital is the general hospital for the Hawaiian artment. In addition to serving as a post hospital for the isons in and near Honolulu, cases of a serious nature and those iiring special treatment are sent here from Schofield Barracks.

he capacity of the hospital is 275, which number may be increased bout 400 beds, if emergency requires, by utilizing the porches.

he staff and equipment are such as to enable it to care for all ses of cases other than the few which require climatic treatment ınusual measures.

he buildings occupy a narrow strip of ground along the rim of a f which faces the south shore of the island and is about 400 yards ant therefrom. The location is attractive and, save for lack of e, desirable. An additional plot of ground of 12 acres adjoining he west is needed badly to permit room for expansion. This plot, ever, can be made available only by purchase or in exchange for ernment lands. An appropriation for the purchase or consional action sanctioning the exchange will be necessary for curing this additional ground.

Vhen considering the fact that but two and one-half years have sed since it was decided to build up the department hospital on present site, wonderful progress has been made in developing from nall plant for a battalion post to its present state of efficiency. ile the hospital is fairly complete as to buildings and equipment, ould be rendered more convenient and susceptible to expansion.

Among the needs cited by the commanding officer, some of which require the appropriation of funds, are the following:

Acquirement of additional land; a cold storage plant; shelter for transportation (already requested and favorably considered by higher authority, but shortage of funds has prevented appropriations therefor); quarters for medical officers and noncommissioned officers; screening of wards; a laundry; passageway, medical clinic to ward block; covered way, administration building to medical clinic; increased accommodations for Roentgen laboratory; landscape gardening; kitchen storerooms; extensions of service roads; disinfecting chamber; electric, silent-call signal system for private rooms; an impervious kitchen floor; raising the level of low lands to eliminate mosquito breeding, and to make land available for hospital purposes (gardens and pasture, with service buildings).

The following table shows the movement of the sick, together with the sources of admission during the calendar year 1916:

	Officers and enlisted men.	General prisoners.	Army Nurse Corps.	Civilians.	Total.
Admissions:					
Command	112		4		116
Transfer	1,330	1		15	1,346
Otherwise	77			385	462
Remaining, Dec. 31, 1915	79			19	98
Total to be accounted for	1,598	1	4	419	2,022
Dispositions:					
Duty	1,351	1	4		1,356
Died	9			7	16
Discharged for disability	1				1
Transferred to Letterman General Hospital	153			3	156
Otherwise disposed of	4			396	400
Remaining, Dec. 31, 1916	80			13	93
Total accounted for	1,598	1	4	419	2,022

There were 16 deaths during the year. Of this number 1 was an officer, 8 enlisted men, 1 retired enlisted man, 6 civilians.

The following were the causes of deaths:

Apoplexy	1
Drug poisoning	2
Gunshot wound	1
Kidney disease	2
Pulmonary edema (secondary to gastric ulcer)	1
Tuberculosis	2
Carcinoma	1
Fracture of skull	1
Heart disease	1
Peritonitis	1
Senility	1
Septicemia	2

But one enlisted man was discharged during the year on certificate of disability. This discharge was for disease contracted not in line of duty.

Forty-three insane patients were treated at this hospital during the year. Of this number 37 were enlisted men, 1 a retired soldier, and 5 civilians. The insane in the military service from this hospital are transferred to the Letterman General Hospital, San Francisco, Cal.

Four hundred and ninety-nine operations were performed, of which number 21 were officers, 299 enlisted men, 1 officer and 31 enlisted men of the Navy, 2 Army Nurse Corps, and 145 civilians.

The following tabular statement, condensed, will furnish an idea of the surgical work performed:

Cranium	2	Abdomen, laparotomy	80
Eye	20	Gynecological, external	6
Nose	48	Gynecological, internal	12
Ear	5	Lower extremity	36
Throat	102	Major operations not included	39
Face	4	Minor operations not included	105
Neck	6	Obstetrical operations	5
Upper extremity	23		
Thorax	6	Total	499

There was a total of 72 confinement cases cared for during the year.

The following is a statement of the laboratory work done for the period covered by this report:

Wassermanns		3,786	Stomach contents	94
Urine examinations		3,087	Malarial hunts	57
Gonococcus, smears for		1,803	Tissue sections	44
Feces		1,076	Inoculations of animals	39
Sputa		713	Serum agglutinations	34
Blood counts		608	Kidney-function tests	33
Miscellaneous		351	Blood cultures	24
Vaccines, autogenous, prepared		179	Milk, fat examinations	23
Vaccines administered		177	Milk, bacterial examinations	9
Treponema pallida, examinations for		132	Autopsies	9
Spinal fluids tested:			Water, bacterial	9
Cell counts	53		Water, chemical	2
Gold chloride	6			
"Kaplan"	6		Total	12,407
"Noguchi"	53			
		118		

In the Roentgen laboratory 3,024 Roentgenograms were made, of which number 2,676 were plates and 348 dental films. In addition 3,184 Roentgenoscopic examinations were made.

The dentist on duty at this hospital reports 1,311 operations on the teeth and gums, 597 fillings, 7 bridges, 2 artificial dentures, and 10 fractures, making a total of 1,927.

The mean strength of the personnel on duty at the hospital for the year was:

Officers	11.46
Enlisted men	104.48
Army Nurse Corps	11.87
Mean aggregate	127.81

PROVIDENCE HOSPITAL.

The act approved July 1, 1916, having appropriated $19,000 for support and medical treatment of destitute patients in the city of Washington, D. C., under a contract to be made with Providence Hospital by the Surgeon General of the Army, for relief afforded was as follows:

Patients in hospital July 1, 1916	85
Admitted during the year	1,338
Total number treated	1,423
Average number admitted per month	119
Number remaining in hospital June 30, 1917	74
Total number of days' treatment afforded	32,333
Average number of days' treatment per patient	22
Average number of patients treated per day	92
Longest term of treatment (days)	365
Shortest term of treatment (days)	1
Number of patients in hospital during the whole year	2

LABORATORIES.

ARMY MEDICAL SCHOOL.

The work in the bacteriological laboratories has been of a varied character, as shown in the following summaries:

TYPHOID-FEVER PROPHYLACTIC.

Vaccine prepared in the laboratory was distributed during the six months' periods as follows:

	June 30, 1916.	Dec. 31, 1916.	June 30, 1917.
Army	340,596	411,278	1,364,241
Navy	84,585	74,862	424,587
National Guard	33,466	....	....
Various Government departments	1,148	1,981	684
Civilians and civilian institutions	536	14,440	927
Total	460,331	502,561	1,790,439

No changes have been made in the preparation of the typhoid vaccine, since our results at present in use have been all that could be desired.

PARATYPHOID-FEVER PROPHYLACTIC.

Mixed paratyphoid vaccine prepared in the laboratory was distributed during the six months' periods as follows:

	Dec. 31, 1916.	June 30, 1917.
rmy	352,598	487,663
avy	....	10,000
ivilians and civilian institutions	....	3
Total	352,598	497,666

Miscellaneous vaccines prepared and distributed to Army posts during the six months periods.

	June 30, 1916.	Dec. 31, 1916.	June 30, 1917.

REPORT UPON WASSERMANN TESTS.

The Wassermann reaction has been performed continuously as a iagnostic test for syphilis. During the year ended June 30, 1917, he total number of Wassermann tests in the laboratory was 6,482, f which 885 were reexaminations; 3,960 were made in accordance ith existing orders calling for a Wassermann reaction on applicants r commission, enlisted candidates for various service schools, ecruits, etc.; and 1,547 examinations of new cases. Of the latter, 87 were of syphilis or suspected syphilis, and 1,060 were from cases ffering with diseases other than syphilis. In addition there were 9 tests made for gonococcus fixation, 219 spinal fluids in three ilutions.

The following table shows the actual results obtained in known yphilitics:

Stage of disease.	Number of cases.	Positive.	Negative.	Per cent positive.
rimary	137	71	66	51.82
condary	171	152	19	88.88
ertiary	162	121	41	74.69
atent	17	10	7	58.82
Total	487	354	133	72.69

CHEMICAL LABORATORY.

The following analyses and examinations were made:

eces	3	Stomach contents	8
testinal concretions	1	Water	14
ow's milk	12	Urine	1,075
oman's milk	2		

X-RAY LABORATORY.

In this laboratory the work done in addition to instruction represented by the following table:

Report of the Department Laboratory No. 1, Southe Department, Fort Sam Houston, Tex., for the Calend Year 1916.

INTRODUCTION.

The volume of work done by this laboratory has been increasi each year since its establishment, due to the influx of troops in the department for duty on the border. During 1916 the increa was very marked, more particularly during the second half of t year, on account of the mobilization of the National Guard, t increase in the Regular Army, and the assignment of most of the units to duty on the border. During most of the second half of t year the number of troops in the department has been approximate 150,000.

In August a second department laboratory was established at Paso, and in September a third at Nogales, Ariz., relieving to son extent the strain on this laboratory. Between July 1 and Decemb 31, 1916, the district covered by this laboratory embraced th garrisoned by approximately 75,000 troops.

This laboratory, in addition to work for the department at larg is also the clinical laboratory for the base hospital at Fort Sa Houston, Tex., which averaged 482 patients daily from July 1 December 31, 1916. The laboratory also administers all typho prophylaxis for the post, takes all blood specimens for Wasserma and other serological reactions for the base hospital, and has admi istered most of the autogenous and stock staphylococcus vaccin prescribed locally during the year. Some idea may be gained of t magnitude of the work done for the base hospital by citation of t following approximate daily averages of a few of the routine labor tory examinations for the past six months.

Blood counts, 11; examinations for malaria, 9; chemical a microscopical examinations of urine, 10; examinations of sputum f tubercle bacilli, 4; urethral smears for gonococci, 5; dark field e aminations for *T. pallidum*, 3; blood cultures for organisms of t typhoid group, 6; and agglutinations, 7, as well as approximately Wassermann tests twice a week.

The increase in the amount of work necessitated increases fro time to time in the commissioned and enlisted personnel. Reques for additional personnel were always met very promptly by t department surgeon's office and by the commanding officer of t base hospital. From January to June, 1916, two officers of t Medical Corps were on duty in the laboratory, in June one addition medical officer was assigned as assistant, and in August still anoth

On September 1 a field laboratory, under the direction of Maj. C. L. ole, Medical Corps, of this laboratory, was ordered to the Browns- ille district to handle the paratyphoid situation in the New York ivision, and the field laboratory continued its activities during the ionth of September.

The floor space of the present laboratory is entirely too limited to andle, without congestion, the amount of routine going through. his congestion, however, soon will be corrected, as a new laboratory uilding is now in process of construction and will be completed in ie early part of 1917.

The following general summary of the activities of this laboratory om January 1 to December 31, 1916, is submitted:

	1916, first six months.	1916, second six months.	Total, 1916.	Total, 1915.
lood examinations:

Comments somewhat in detail concerning certain features of th work of this laboratory during the year 1916 are considered desirabl and follow.

Typhoid-paratyphoid.—During the early part of the summer c 1916 it became evident to this laboratory that both typhoid an paratyphoid might be expected to develop in troops entering Mexic as one case of typhoid and two or three cases of paratyphoid occurred in men on duty with the punitive expedition soon after i entry into Mexico. These men were invalided back to the bas hospital at El Paso, Tex., with undetermined fevers, the diagnos being established in this laboratory by cultural methods. In Apri 1916, *B. paratyphosus* A was isolated by blood culture from Serg M. K., of the Twenty-eighth United States Infantry, stationed a Mission, Tex., and very soon thereafter (May 23, 1916) the sam organism was isolated by blood culture from a civilian at Missio In June a second case of paratyphoid A occurred in the Twenty-eigh United States Infantry. These three cases were diagnosed clinicall by Majs. W. N. Bispham and C. L. Foster, Medical Corps, Unite States Army, as belonging to the typhoid-paratyphoid group.

In July, 1916, a brigade of the New York National Guard too station at Mission, Tex., and within a few weeks thereafter we bega to recover *B. paratyphosus* A by blood culture from patients wit undetermined fever transferred from Mission to the base hospita Fort Sam Houston, Tex. This marked the beginning of a shar but mild epidemic of paratyphoid A in the brigade of New Yor

oops at Mission. Paratyphoid A also appeared in other organi-
itions of the New York division and in other troops stationed in
ie Brownsville district. A summary of the laboratory work done
i suspected typhoid-paratyphoid fevers is presented below:

As will be noted, only 3 individuals in the regular service and in the militia contracted typhoid, notwithstanding the fact that was endemic all along the border. The typhoid immunization reco of these patients was as follows:

	1912	1913	1914	1915	1916	Non
Regulars	1	1	....	....	....	
Militia	....	....	1	3	[1] 18	
Civilians	....	....	....	....	....	

---

[1] One individual reported as having only one dose of prophylactic, and one as having two doses.
[2] Militiaman reported as having no prophylactic; was administered first dose on July 25, but was adm ted to hospital with typhoid on the following day, July 26.

The typhoid-prophylactic record of the three cases occurring i Regular troops has been thoroughly investigated and is correct, b it has not been possible to authenticate the records of the patien belonging to the militia.

The particularly striking thing shown by the prophylactic recor charted above, is the fact that no individual in the Regular Army wh had been protected by prophylactic vaccination within the past thre years contracted typhoid. These statistics, confirming those co lected abroad, more particularly in the British service, indicate th typhoid immunization gives a very high degree of protection again typhoid for at least three years, after which time one tends to becom slightly susceptible. This observation suggests that it might b desirable to revise General Orders No. 4, War Department, 1915.

Paratyphoid.—During 1916, 247 cases of paratyphoid A and cases of paratyphoid B were identified by this laboratory. Th distribution of these cases and laboratory method of identification shown below:

	Blood cultures.	Agglutination.	Cultures from feces or urine.	Total 1916.
Regular troops:				
Paratyphoid A	17	3	....	
Paratyphoid B	....	....	....	....
Militia:				
Paratyphoid A	180	42	4	2
Paratyphoid B	2	....	1	
Civilians:				
Paratyphoid A	1	....	....	
Paratyphoid B	....	....	....	....

A special report covering the paratyphoid situation from th laboratory point of view is in course of preparation and will be sub mitted in the near future.

Syphilis.—(*a*) Wassermann's on blood. During the year, 9,098 Wassermann reactions were done on blood specimens. The average number of routine tests per month, for the past six months, was 880. The distribution, according to character of reaction, of the total number of tests by months is shown in the following table:

Month.	Negative.		+ −		+		+ +		No test.		Total number.	Total positive.
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.		+ and ++

October	687	78	33	4	55	6	54	6	53	6	882	12
November	502	71	44	6	39	6	86	12	36	5	707	18
December	619	74	38	5	55	7	86	10	37	4	835	17
Total	6,637	72	565	7	438	5	859	10	599	6	9,098	15

This table is presented mainly for the purpose of showing the number and percentage of specimens received by the laboratory in such condition that it was impossible, for one reason or another, to submit a report. It will be noted that no reaction could be reported on 599 of 6 per cent of the total number of specimens received during the year. The specimens falling in this class consisted of these "broken in mail," burned, haemolyzed, and anticomplementary.

The percentage of specimens of this class is altogether too large, and could be reduced very materially by the devotion of some attention to the sealing of capsules properly to prevent burning and to packing the capsules properly for mailing. It is the experience of this laboratory that specimens of whole blood in capsules, even though apparently in perfect condition, not infrequently are anticomplementary when tested. This applies more particularly to specimens in transit in the mails for a considerable length of time. The substitution of separated serum for whole blood in such instances enables us almost invariably to report satisfactory reactions. At our request the base and camp hospitals in our district are now forwarding separated serum exclusively, and the influence of this procedure on the number of specimens received in an unsatisfactory condition is very clearly evidenced by the marked reduction in the percentage of unsatisfactory specimens received—September, 10 per cent; December, 4 per cent. This method of forwarding specimens for Wassermann and other serological examinations should, in our opinion, be adopted when feasible, as a routine measure throughout the service.

We have tabulated separately the results of the Wassermann test for the National Guard and for the United States Army. Our records show 1,865 routine initial tests on soldiers in the National Guard and 2,274 on soldiers in the regular service during the period July 1 to

December 31, 1916, and we have tabulated the following summary the number of syphilitics in each group:

	Regular troops.		National Guard.	
	Number.	Per cent.	Number.	Per cen
Initial examinations:				
Positive	370	16	348	
Negative	1,904	84	1,517	
Reexaminations:				
Positive	109	22	20	
Negative	394	78	69	

The above figures indicate on their face that syphilis is mor prevalent in the National Guard on duty in this department (19 pe cent of those examined) than in regular troops (16 per cent of thos examined).

We have made Wassermann examinations on one group of mer applicants for enlistment, the results of which may be considere as indicating the prevalence of syphilis in presumably normal ind viduals accepted as recruits.

Of 251 applicants for enlistment, 5 or 2 per cent gave a positiv reaction. In 1915 in a total of 123 such cases examined 13 or 10. per cent were positive. No conclusions of any value can be draw from such statistics until many thousands of such examination have been analyzed.

On account of the frequently changing personnel in the departmen and the lack of familiarity with Medical Department forms on th part of the commissioned officers of the Medical Corps of the Nationa Guard and the Medical Reserve Corps, this laboratory has receive a very large number of Wassermann requests, and a still larger num ber of Wassermann cards (Form 97), improperly or incompletel filled in or not made up at all (596 cards incompletely filled in wer received between October 1 and December 31, 1916). For thi reason we have been unable to compile from the Wassermann card any statistics in which we personally have any confidence. Suc information as we have been able to compile is presented below:

Known cases of syphilis.	Number of cases.		Number positive.		Number negative.		Percentage positiv	
	Regulars.	Militia.	Regulars.	Militia.	Regulars.	Militia.	Regulars.	Militia.
Primary	137	96	56	50	81	46	41	52
Secondary	538	154	432	123	106	31	80	80
Tertiary	132	51	94	37	38	14	71	72.
Latent	73	37	65	37	8	....	89	100
Hereditary	6	1	5	....	1	1	83	....

(*b*) *Spinal fluids.*—As a matter of routine, the following examina tions are carried out on spinal fluids: Cell count, Wassermann (dilutions), globulin increase, and colloidal gold reaction. This grou of reactions has been done on about 100 spinal fluids during the yea and the results reported have been of very definite value to th clinicians.

(*d*) *Dark-field examinations.*—During the year 596 lesions, sus-ected of being syphilitic, were examined by the dark-field method, nd *Treponema pallidum* was found in 16 per cent. It is our pinion that this very valuable laboratory aid to the diagnosis of yphilis in its very early stages should be made a matter of routine t all military stations where facilities (electricity or gas) exist for arrying it out.

Diphtheria.—It will be noted from the table summarizing the work f this laboratory that a very considerable number of throat cultures ere examined for *Bacillus diphtheria*, with a large percentage of ositives—99 positive, 315 negative. Practically all this material ame from the camp of National Guard troops at Llano Grande, ex. Cases of diphtheria of a mild type began to appear there in ctober and persisted until the latter part of November. During ctober we reported on 169 throat cultures, 57 of which were ositive for *Bacillus diphtheria*. In November, 113 throat cultures ere examined, with 25 positive. The sanitary inspector at Llano rande informed us that many of the positive cases were contacts nd carriers without clinical symptoms.

When cases of diphtheria began to appear in this camp this labo-atory forwarded the camp sanitary inspector a supply of diphtheria oxin, for use in performing the Schick test on contacts, and it is our nderstanding that this test gave quite satisfactory results. This boratory is indebted to the laboratory of the New York City oard of health for a supply of diphtheria toxin for these tests. The chick test is a reliable one, quickly and easily performed on large umbers of people at an insignificant cost, and its use during epi-emics will eliminate nonsusceptibles, thus curtailing very materially he expense incident to the purchase of diphtheria antitoxin for im-unization purposes. It is recommended that arrangements be per-ected for keeping a potent supply of this toxin on hand at each epartment laboratory for emergency supply to posts or camps when pidemics of diphtheria threaten.

Malaria.—During the year 197 microscopical examinations for alarial parasites were positive. The distribution of the cases and umber of examinations by months was as follows:

	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
ositive	1	......	......	......	13	9	14	26	66	51	14	3	197
egative	20	1	7	11	31	17	100	313	424	360	117	87	1,475

Practically all the cases occurred in troops making up the twelfth ivision at Camp Wilson, Fort Sam Houston, Tex. A study of the istribution of the cases by organizations and the movements of he units making up the division demonstrated very clearly that the isease was being contracted on maneuvers in the vicinity of New raunfels, Tex.

It is also probable that malaria may be contracted at the Leon prings Military Reservation, but it is our experience that it but eldom or practically never originates at Fort Sam Houston.

Dysenteries.—Dysentery of the protozoal type was but rarely ob-erved in this laboratory. A few cases of bacillary dysentery have been identified by isolation of the specific organism or by agglut nation reactions.

During the past summer an organism in almost pure culture w isolated by Lieut. Schule from the stools of three or four cases clinical dysentery. The organisms apparently belonged to the dyse tery group, but did not conform to the cultural characters or agglut nation reactions of any one of the organisms of the dysentery grou heretofore described. Stock cultures of these organisms are bei saved, in the hope that a decrease in necessary routine work m permit their investigation at some time in the near future.

Vaccines.—A very considerable amount of attention has been giv during the year to the preparation and administration of vaccin and to the observation of their effect on cases of furunculosis, certa selected cases of skin diseases, and some chronic lesions, the etiolog of which could be traced to the presence of some of the more comm microorganisms. Occasional striking results have followed the u of the vaccines in a limited number of the cases, and good resul have followed in many.

Water analyses.—During 1916, 23 complete chemical analyses water were done, as compared with four in 1915. Analyses of th kind require a very considerable amount of special apparatus, co stant attention to the standard solutions, trained technicians, a careful supervision. The results obtained from chemical analys frequently are indefinite, their interpretation difficult or impossibl and altogether they appear to be of but little practical value as co pared with bacteriological analyses. The technique for bacteri logical analyses of water is simple and easily carried out, and t results obtained usually are quite definite and clear cut.

In view of the facts cited above, it is recommended that the routi chemical analyses of water supplies be discontinued and that chen ical examinations be confined to ones desired for special purposes.

Seventy-five bacteriological examinations of water were made 1916, as compared with 15 for the previous year. The objection this method of analysis is that the samples usually are in transit the laboratory for at least 24 hours, during which time they are n packed in ice. It is our custom to omit the colony counts on su samples and to do only the presumptive test for organisms of t colon group, subsequently identifying any gas producers presen It has been our experience that organisms of the colon group are n ordinarily overgrown in 24 to 48 hours, and we have even identifi organisms of this group in samples of water from Mexico that we in transit for a period of six days.

A number of the samples examined in this laboratory have show a high percentage of gas by the presumptive test, and members the colon group practically always have been identified. Many su samples were drawn from irrigation canals, rivers, and other colle tions of water exposed to the droppings of range cattle. If the sour of contamination is from the excreta of range cattle rather than fro the excreta of human beings, the presence of organisms of the col group is believed to be of no particular sanitary significance.

Milk analyses.—The routine procedure for the chemical and ba terial examination of milk samples, instituted in this laboratory the fall of 1915, has been continued throughout 1916. During 19 three posts were designated by the department commander fro which milk samples were to be forwarded once each month. During 1917 it is the intention to extend this service to all the more important permanent and semipermanent posts in the department.

Chemical examination of malt beverages.—During 1916 this laboratory made chemical examinations of 17 specimens of malt beverages to determine the alcohol content. As these beverages are handled by post exchanges and presumably have an alcohol content of approximately 2 per cent by volume, it may not be amiss to invite attention to the results of some of the examinations made by this aboratory. We have found that the alcohol content of some of these beverages varies from time to time and frequently is higher than is permissible by law. As an example of the widest degree of variation in samples of the same product, the following results are cited:

Date of examination.	Per cent of absolute alcohol.		Date of examination.	Per cent of absolute alcohol.	
	By weight.	By volume.		By weight.	By volume.
Nov. 2, 1915	1.61	2.03	Feb. 27, 1916	2.062	2.60
Nov. 4, 1915	1.61	2.03	Sept. 6, 1916	1.99	2.51
Do	5.77	7.32	Sept. 10, 1916	1.94	2.44
Nov. 11, 1915	1.94	2.44	Sept. 30, 1916	5.96	7.51
Do	1.87	2.35	Oct. 2, 1916	2.34	2.95

The samples in this series were identical as to manufacturer's bottle, bottle cap, and label, and were selected from the stock sold by post exchanges.

Laboratory animals.—Climatic conditions in Texas are conducive to the rearing of guinea pigs, and this laboratory, for the past two years, has had no difficulty in raising a supply, more than adequate to meet its demands. During 1916 more than 300 pigs were required or complement alone, and between August and December, 1916, 238 pigs were shipped to the department laboratories at El Paso, Tex., and Nogales, Ariz.

Early in December, 1916, an epidemic disease appeared among the guinea pigs that killed between 150 and 200 of the best and oldest stock. The organism responsible for the epidemic was definitely proven to belong to the paratyphoid group, and biologically was more nearly akin to paratyphoid B than to paratyphoid A. The epidemic was finally controlled by segregation of the animals nto small groups, isolation of those ill, and thorough disinfection of nfected pens. As the infection was practically confined to one room—that containing the breeding females—all animals in this room were immunized with a prophylactic vaccine. During the height of the epidemic, a number of mice and some cockroaches, that had been in the habit of preying on the food of these animals were found dead or ill, and an organism apparently identical with that isolated from the guinea pigs was recovered from both sources.

New routine tests.—During the year, two new diagnostic methods have been introduced as routine tests, namely, the gonococcus fixation test and chemical blood analyses. The gonococcus complement fixation test was begun in September, and during the last four months of the year 166 such tests were done.

The recently developed methods of chemical analyses of the bloo of demonstrated practical value, such as blood sugar estimation creatinine determinations, etc., recently have been added to o list of routine tests offered.

Supplies issued on request.—There was a very marked increase i the number of requisitions for biological products and laborator supplies during 1916. In this department it is customary for th department laboratory to supply, on direct requisition, most of t biological products ordinarily used—typhoid, paratyphoid, gonoco cus, stock staphylococcus, streptococcus, acne, and smallpox va cines—and an extraordinarily large amount of these products nece sarily were used during the year.

A summary showing the amount of biological products, laborator supplies, etc., issued by this laboratory to medical units in the depar ment is submitted below:

Articles issued posts and commands on requisition.	Units.	1916, first six months.	1916, second six months.	Total, 1916.	Total 1915.
Typhoid vaccine	c. c	69,483	209,180	278,663	5,
Paratyphoid vaccine	do	....	61,669	61,669	....
Gonococcus vaccine	do	294	2,102	2,396	
Smallpox vaccine	Units	15,138	65,843	80,981	10,
Antitetanus serum	Packages	35	35	70	....
Mailing cases	Number	1,573	5,265	6,838	1,
Schick tests	do	....	210	210	....
Containers for water, chemical	do	26	108	134	....
Containers for water, bacteriological	do	5	27	32	....
Containers for milk, bacteriological examination	do	50	78	128	....
Containers for feces	do	4	494	498	....
Containers for urine	do	6	20	26	....
Containers for sputum	do	4	40	44	....
Articles prepared in laboratory and issued on requisition.					
Staphylococcus vaccine	c. c	288	650	938	
Bile medium	Bottles	196	2,917	3,113	
Bile medium, in bulk	Liters	....	14	14	....
Loeffler's blood serum	Tubes	54	604	658	
Diphtheria culture tubes	Number	....	637	637	....
Russell's double sugar media	Tubes	....	2,060	2,060	....
Miscellaneous culture media	do	58	48	106

Serum capsules	do	....	149	149	....
Spinal fluid tubes	do	....	39	39	....
Miscellaneous stains	C. c	860	1,950	2,810	
Miscellaneous articles	Number	978	4,515	5,493	....

The issue of biological products by this laboratory, on requests b telegraph or by mail, to all medical department units in the depar ment has simplified and expedited the receipt of such supplies whe urgently needed. It is suggested that each department laborato could, to great advantage, be designated as a depot for the issue many of the standard biological products.

Special work.—The activities of this laboratory are of necessit concerned primarily with the class of practical laboratory work th tends to aid the clinician. With the limited commissioned an enlisted personnel and the cramped space available it has bee impossible and impracticable to attempt much more than routin New laboratory methods of proven value—spinal fluid examination chemical blood analyses, bacterial complement fixation tests—a being introduced as routine from time to time, and when sufficie naterial has been collected, their value to the military service will e made the subject of special reports. If special lines of investigaion are to be undertaken, and it is our opinion that work of this haracter should form a very appreciable part of the work of the lepartment laboratory, it will be necessary to increase the permanent ersonnel, both commissioned and enlisted. This particular laboraory should have at least three commissioned medical officers under ormal conditions. Under the abnormal conditions existing at the resent time, four medical officers are required to do the routine vork with scarcely any time for special work.

During the year 1916, a number of special lines of investigation vere taken up but none of them could be carried to completion, as the mount of routine work being done prevented any consecutive work long special lines. Among the investigations undertaken, the ollowing may be mentioned:

Tentage preservation.—The infection with molds of tentage in the Brownsville district has resulted in the loss of a very considerable mount of tentage, and Maj. Cole, of this laboratory, for several nonths has been investigating in an experimental way the prevenion of such infections by impregnation of the tentage with chemicals f various kinds. It is believed that these investigations will prove o be of value to the military service and that a practical and economial method of tentage preservation will be worked out.

Paratyphoid.—The occurrence of a considerable number of cases f paratyphoid fever in the department has enabled this laboratory o gain a considerable amount of information of practical value relative o the organisms of the typhoid-paratyphoid group. A series of apers covering the work are in course of preparation and will be ubmitted when completed.

Milk analyses.—A series of chemical and bacteriological tests for nilk supplies that appeared to be applicable to service conditions vere tried out practically during 1916. Particular attention is now eing paid to a comparison of the Stewart-Slack and the Prescott-Breed methods of direct bacterial count. The direct counts are also eing checked against the colony counts in the milk samples from Fort Sam Houston. The results of these investigations will be made he subject of a special report when sufficient material has been ollected.

REPORT OF DEPARTMENT LABORATORY NO. 2, SOUTHERN DEPARTMENT, MILLS BUILDING, EL PASO, TEX., FROM DATE OF OPENING, JULY 23, 1916, TO DECEMBER 31, 1916.

In accordance with letter of instructions from department surgeon, headquarters Southern Department, Fort Sam Houston, Tex., dated December 18, 1916, I herewith submit a report of the work done in Department Laboratory No. 2, Mills Building, El Paso, Tex., from the date of the opening of the laboratory, July 23, 1916, to December 31, 1916.

When the militia was ordered to the border this laboratory was established at the request of the department surgeon to care for the laboratory work requested from the district included in the area west of the Big Bend district to the Pacific, including the punitive expedition in Mexico. Later Department Laboratory No. 3 was established at Nogales, Ariz., taking over that portion of the work include in the territory from Nogales to the Pacific.

At first it was intended that Department Laboratory No. 2 shoul be established at Fort Bliss, Tex., in conjunction with Base Hospit No. 2 at that place, but there being no suitable building availabl and as it would have taken some weeks, or even longer, to erect suitable structure, rooms were hired for the laboratory on the twelft floor of the Mills Building, which are almost ideal for the purpos By securing permission to have the complete equipment of th department laboratory of the Central Department at Fort Leavenworth (of which I had charge at the time the order for the establishment of this laboratory, was issued) sent to El Paso by express, th equipment arrived at that city on July 12, 1916, the order directin the establishment of the laboratory being issued on June 30, an on July 23, the equipment having been installed, the laboratory wa opened for work, although it was several weeks later before the shelving necessary for the equipment was completed.

On my recommendation, approved by the commanding officer o Base Hospital No. 2, and the department surgeon, authority wa granted by the War Department on October 21, 1916, making th laboratory a separate command under the headquarters of th Southern Department. This change was recommended because i would greatly simplify and expedite administrative measures, and i has resulted in greater efficiency and has relieved the base hospita of considerable administrative work connected with the laboratory It is believed that department laboratories should, wherever possible be separate commands, directly under department headquarters This will always work for efficiency and prevent the detailing of th officers and men assigned to them away from the laboratory, by loca commanders, which, in the past, has greatly injured the work o some of these laboratories, as I know from personal experience.

Owing to the large amount of work that was sent to the laborator as soon as it was ready for operations, I requested that Maj. Henr J. Nichols, Medical Corps, United States Army, in charge of th laboratory at the Letterman General Hospital, San Francisco, Cal. and Capt. Felix R. Hill, Medical Corps, United States Army, on dut at El Paso, be assigned to the laboratory, and Maj. Nichols reporte upon August 7, 1916, and Capt. Hill upon September 17, 1916. Th enlisted personnel consists of two sergeants, two corporals, and tw privates first class of the Medical Department.

From July 23, 1916, to December 31, 1916, 8,545 examination have been made in the laboratory, distributed as follows:

ABLE 1.—*Examinations made in Department Laboratory No. 2 from July 23, 1916, to Dec. 31, 1916.*

Character of examination.	Number.	Results.
mplement fixation tests:		
1. Wassermann tests	4,231	
2. Tuberculosis tests	110	
3. Gonococcus tests	62	
4. Glanders tests	12	
Total	4,415	
ces for endamæba histolytica	1,526	Positive, 164.
ood cultures for typhoid group	477	Positive.—Typhoid, 14; paratyphoid A, 99; paratyphoid B, 1.
ces cultures for typhoid group	658	Positive.—Typhoid, 0; paratyphoid A, 5; paratyphoid B, 1.
le cultures (duodenal contents) for "carriers"	26	Positive.—Typhoid, 1; paratyphoid A, 1.
ine cultures for typhoid group	85	
glutinations for typhoid group	246	
ood cultures, miscellaneous	78	
phtheria cultures	457	Positive, 37.
ater, bacteriological	80	
utum for B. tuberculosis	52	Positive, 10.
alarial plasmodia	15	Positive, 2.
amination for spirocheta pallida	47	Positive, 11.
aminations for gonococci	22	Positive, 10.
aminations for bacillus of Ducrey	12	Positive, 10.
amination of meningitis contacts	29	
inal fluid for meningococcus	9	Positive, 7.
ltures for pneumococcus	5	Positive, type 1, 2.
ine, chemical and microscopical	65	
aminations for negri bodies	3	Positive, 1.
aminations for bacillus mallei	5	Positive, 5.
lk, chemical and bacteriological	5	
omach contents, chemical	20	
omach contents for strychnine	1	Positive, 1.
hisky for strychnine	1	Do.
imal inoculations	86	
scellaneous examinations	120	
Total	8,545	

In addition to the examinations made in the laboratory the follow-
g supplies have been furnished the various commands in the district
pplied by the laboratory:

ABLE 2.—*Supplies furnished by department laboratory No. 2 from July 23, 1916, to Dec. 31, 1916.*

Articles supplied.	Amount supplied.	Articles supplied.	Amount supplied.
right's capsules and tubes for Wassermann test	5,500	Antimeningitis serum (Flexner's), cubic centimeters	400
rine containers	135	Colon vaccine...... cubic centimeters	36
ces containers	758	Gonococcus vaccine ..... do	846
ater containers (bacteriological)	105	Paratyphoid vaccine ..... do	1,728
utum bottles	142	Staphloacne vaccine ..... do	576
le medium, bottles of	600	Staphylococcus vaccine ..... do	60
lood serum, Loeffler's, tubes of	657	Streptococcus vaccine ..... do	84
ntidysentery serum (Flexner's), cubic centimeters	3.000	Typhoid vaccine ..... do	2,260

Complement fixation tests.—In all, 4,415 complement fixation tests
ave been made for the diagnosis of syphilis, tuberculosis, subacute
nd chronic gonorrheal infections, and glanders, divided as follows:
Vassermann tests, 4,231; tuberculosis, 110; gonorrhea, 62; and
landers, 12.

The Wassermann test.—During the time covered by this report there
ave been 4,231 Wassermann tests made in the laboratory, of which

929 were reexaminations made largely for the determination of tl results of the treatment, and 3,302 were original examinations. the latter, 877 were upon cases diagnosed as probable syphilis or su picious of that disease, while 2,245 were made upon patients sufferir from other diseases but in whom it was desired to eliminate syphili

Of the 877 tests made upon patients in whom syphilis was diagnose or strongly suspected, 694 gave a positive reaction, or practically per cent. These cases were divided, as regards the stage of the di ease, as follows:

TABLE 3.—*Results of Wassermann tests made in department laboratory No. 2 from Ju 23, 1916, to Dec. 31, 1916.*

Stage of disease.	Number of cases.	Positive.	Per cent.	Negative.	Per cer
Primary	213	174	81.6	39	1
Secondary	341	323	94.6	18	
Tertiary	85	67	78.8	18	2
Latent	238	130	54.6	108	4

Continued experience with the Wassermann test, employing tl technique which I have followed since 1913, has resulted in firm convincing me of its great value in the diagnosis and as a control the treatment of syphilis. The technique used is that now employe in most of the Army laboratories and has stood the test of years, ar it is believed is as nearly perfect as it is possible for the technique any test to become. Some changes have been advocated, but it not thought that the method should be changed in its essential fe tures. Especially is the adoption of a sheep hemolytic system instea of the human hemolytic system now in use deprecated, for while may be less difficult to work with in some respects, the gain in th direction is more than compensated for in the greater accuracy of tl human hemolytic system, which is certainly the ideal one for con plement fixation tests upon human blood serum. The fact th human serum sometimes contains a considerable amount of natur amboceptor against sheep cells is alone sufficient to decide in favor the use of the human system, and recent work has shown that th factor is one that can not be overlooked or slighted. The most recen observations are all in favor of the use of a human hemolytic syste in complement fixation work upon human blood, and mere ease preparation of amboceptor or other retechnical procedures should n weigh against the use of this system. It has been used by the writ since 1913 with the greatest satisfaction, and it is believed that should invariably be employed in the Wassermann test if the greate degree of accuracy is desired in the application of this test.

Complement fixation in tuberculosis.—One hundered and ten con plement fixation tests for tuberculosis have been made, of which were in cases diagnosed as suspicious of the disease and 45 were cases suffering from other diseases in which it was desired to elimina tuberculosis. Of the 65 suspected of tuberculosis, or so diagnose 59 gave a positive reaction, or a little over 90 per cent. In only s of the cases giving a positive reaction could tubercle bacilli be demo strated in the sputum at the time the test was made, although mar of the cases have since shown the organism in the sputum. Of tl six cases diagnosed as suspected tuberculosis that reacted negatively, only two showed the bacilli in the sputum, the remainder still being undetermined as tuberculous cases. The two cases showing tubercle bacilli in the sputum that reacted negatively were rapidly advancing cases, and it has been my experience with this test that in such cases the reaction is frequently negative, owing apparently to the lack of formation of the substance or substances giving the reaction because of the overwhelming infection.

The antigen used in these tests has been a polyvalent alcoholic extract of several strains of the tubercle bacillus prepared as described in my article published in the American Journal of Medical Sciences for December, 1915. A human hæmolytic system has been used, and the general technique of the test is the same as employed in the Wassermann test. The results obtained since the publication of my original article have been collected and will be published in an early number of the Journal of the American Medical Association.

The complement fixation test for the diagnosis of tuberculosis has proven, in my experience, a most valuable measure for the detection of early cases of the disease and as an index of recovery from the infection. Since the publication of the paper referred to, a great deal of work has been done upon the subject by different investigators and all of it has been confirmatory of the value of this test in the diagnosis of the disease. I believe that it will soon be as widely used as is the Wassermann test in the diagnosis of syphilis and that it has already been placed upon a practical basis and should receive much more attention than it has so far received by those who are especially interested in the tuberculosis problem.

Complement fixation in gonorrheal infection.—This test has been made upon 62 patients in whom some form of subacute or chronic gonorrheal infection was suspected. Positive results have been obtained in only three instances and my experience with the test has been distinctly unfavorable so far as its being of any very great value in diagnosis is concerned. The antigen used has been a polyvalent one carefully prepared and titrated, and the failure of the test to give positive reactions in many cases undoubtedly gonorrheal in origin can not be explained by a poor antigen.

Complement fixation in glanders.—The complement fixation test for glanders has been made upon 12 suspected horses with a positive result in 8 cases. The horses giving a negative result presented only very slight lesions of the disease or the lesions were those of another condition. This test appears to be a very satisfactory diagnostic procedure when there are lesions of the disease present but it is useless if subcutaneous injections of mallein have been given within two months previously, as such animals will give a positive reaction with the test.

Examinations for endamœbic dysentery.—During the time covered by this report, 1,526 examinations of feces have been made for *Endamœba histolytica*, and 164 cases were found positive. These examinations were necessitated because of an outbreak of this disease in the camps in and around El Paso between August, 1916, and November, 1916. A special report has been prepared and forwarded dealing with the epidemiology of this epidemic, but the following points may prove of interest to the military surgeon who h to handle similar outbreaks of the disease.

A careful study of the epidemiology of endamœbic dysentery, it occurred at El Paso, resulted in the conclusion that most of t cases originated from "carriers" and the disease was transmitt by flies. Several true "carriers" or, as they are often termed, "co tact carriers" of cysts of *Endamœba histolytica* were discovered du ing routine examinations of feces and most of the patients havi the disease became "convalescent carriers" of the infection. Thus, the 115 soldiers having endamœbic dysentery, and observed for as lo a period as two months, no less than 86, or practically 75 per cen became "convalescent carriers" of the infection. In practically all these cases one course of 12 grains of emetine hydrochloride, in dai doses of one grain, was given, and in many of them this course w repeated. That the disease was transmitted by flies in the majori of instances is proven by the following facts:

1. The number of cases of dysentery increased with the increa in the number of flies in the camps and the new infections ceased wi the disappearance of the flies.

2. The greatest number of cases occurred in camps where the fl were most numerous.

3. Conditions regarding temperature, water and food supply, wi and dust, and disposal of excreta were the same before, during, a after the epidemic. The only factor that differed was the number flies present in the camps.

4. Contaminated water, eating of raw food in Mexican reso contamination of food or drink by infected dust, and direct infecti by contact have all been excluded as methods of transmission in t particular epidemic.

Treatment with emetine hydrochloride has not been success either in preventing the development of cysts of *Endamœba histo tica*, and therefore the development of "carriers," or in causing t cysts to disappear permanently after they have appeared. While t drug has a very beneficial effect upon the symptoms of endamœ dysentery it is not curative, if by cure is meant the permanent remo of the infection by the destruction of all of the endamœbæ.

As a result of the investigation of the epidemiology of the epide of endamœbic dysentery observed here the following recommen tions regarding the prophylaxis of the disease were submitted in t special report referred to previously:

1. When a case of endamœbic dysentery is discovered in organization a microscopic examination of the stools of all soldi in the organization who have to do with the preparation or servi of food or drink should be made for the cysts of *Endamœba histolyti* and, if possible, the examination should include all members of t organization.

2. If "carriers" of the infection are discovered they should admitted to hospital at once and treated, the treatment being c trolled by weekly examinations of the stools, extending over a peri of at least two months after the completion of treatment. It is usel to base a diagnosis of a cure of the infection upon the absence of t endamœbæ from the stools a week or two after cessation of tre ment, for in most instances, the endamœbæ disappear shortly af treatment is begun, but only to reappear later.

3. If "carriers" prove resistant to treatment they should be ischarged from the service. Experience has shown that unless his is done it will be necessary to carry them in hospital indefinitely, f danger of their spreading the infection is to be avoided.

4. The stools of all individuals showing any form of *Endamœba istolytica* should be disinfected immediately after passage, whenever racticable. This rule should never be broken where it is necessary o dispose of the excreta in latrines, or by any method where it is ossible for flies to gain access to the stools.

5. The screening of cook houses, mess halls or tents, and of food rom flies is a measure of paramount importance, as these insects re undoubtedly the greatest factor in the spread of endamœbic dysentery under conditions present in temporary or semipermanent amps.

6. The prevention of the breeding of flies, and their destruction, f breeding can not be prevented, is a prophylactic measure of great mportance. To this end picket lines should be as far removed as ossible from quarters and mess tents, and no manure should be llowed to collect; all collections of organic matter suitable for the reeding of flies should be sought for and destroyed; latrines should e built as nearly fly proof as possible, and if not fly proof, should be reated with a mixture of kerosene and lampblack; fly traps should e extensively used and frequently emptied; and camps should e located as far away as possible from native habitations in regions where endamœbic dysentery is endemic.

7. The water supply should be carefully guarded from infection nd if there is any question of its purity, it should be boiled or the yster bag be used.

8. In regions where the disease is endemic the use of uncooked ruits, vegetables, and salads should be prohibited.

9. Physicians and nurses who have the care and handling of cases f this disease should take the same precautions as regards personal rophylaxis as they would in handling cases of typhoid, paratyphoid, r similar infections.

10. Patients suffering with the disease or who become "carriers" f it should be informed of the danger of their transmitting it to the ealthy, and instructed regarding the measures that they may take o prevent such transmission.

Diagnosis of typhoid and paratyphoid fever.—During the period overed by this report 477 blood cultures have been studied for the yphoid group of organisms, and 658 cultures have been made from æces for diagnostic purposes. In addition, 246 agglutinations have een made for the typhoid and paratyphoid bacilli and 85 cultures rom the urine.

Of the blood cultures, 14 were positive for the typhoid bacillus, while 99 were positive for paratyphoid A and one for the paratyphoid B organism. There is appended a complete list of the cases proving ositive, with the data of importance concerning them.

Of the 14 cases giving a positive blood culture for the typhoid acillus, no data regarding immunization with typhoid vaccine was btained in three cases; in nine immunization had been completed with the Army vaccine, in one case in 1911; in one case in 1912; n two cases in 1914; and in five cases in 1916. Two positive cases had been immunized with Massachusetts State vaccine and one with Idaho State board of health vaccine. In two cases we we unable to determine what vaccine was used.

Maj. Nichols, who has had charge of the diagnostic work of t laboratory as regards typhoid and paratyphoid fevers, states follows regarding the use of blood cultures in the diagnosis of the infections:

"*Blood cultures in typhoid group.*—The present blood-cultu technique is very satisfactory, the only drawback being that medic officers in some cases do not take specimens early enough in t disease. If in every suspected infection in this group, 2–3 c. c. blood were taken in the first few days and put into bile media in a Wright's tube or vial and sent to a properly equipped laborato very few cases would be missed.

"The present technique used in this laboratory consists of addi 2–3 c. c. of blood, preferably from a vein, to 5 c. c. of sterile bi after 24 hours incubation, Russell's double sugar and Endo plat are inoculated; after 24 hours incubation, if the case is positive a the growth fairly pure, agglutination is made directly from En plates. Hence if the specimen comes from some distance so that it incubated in the bile en route a diagnosis can be given in 24 hou in favorable cases. If the specimen is badly contaminated, 48 hou is necessary. In a few cases with atypical or doubtful reactio a longer time of course is required.

"*Feces cultures for typhoid group.*—This work has been rat unsatisfactory, less than 1 per cent of specimens examined bei positive. This result is partly due to late examination, owing the shipment of specimens from a distance, but it is also partly d to the method itself, as known positive cases, examined early, ev with brilliant green enrichment, have failed to show the organism

"Some observations on the examination of duodenal cultures ha been made and this method is believed to be much superior for t detection of cases and carriers."

A special report upon this subject has been prepared for pub cation.

Water examinations.—At the time the laboratory was opened the was no data regarding the bacteriological character of many of t wells supplying troops camped along the border, and accordingly have endeavored to make a water survey of all sources of supp within the El Paso district. The water has been collected personal in most instances, and at the present time we have a record of t bacteriological character of the water in nearly all localities wh troops are camped in the district.

It is interesting to note that in almost every instance the wa was found to be badly contaminated, most of the water being tained from surface wells, and that in many instances no obvi source of contamination could be determined. Our examinati prove that nearly all surface well water in this region is danger and should be sterilized before use.

General examinations.—The table illustrates the character of t general examinations made in the laboratory and demonstrates th they cover a wide field. Fortunately, there is a well-equipp clinical laboratory at Base Hospital No. 2, and this has relieved t laboratory of an immense amount of routine work. If this w had been added to the work requested from the laboratory, it wo

ve been necessary to have had another medical officer assigned
the laboratory and at least two more privates of the Medical
epartment.

Research work.—Owing to pressure of routine examinations it has
en impossible to conduct very much research work and that
tempted has been along lines that could be worked out in con-
nction with routine examinations, to a large extent. A study was
ade of the epidemiology of the outbreak of endamoebic dysentery
at occurred here in the summer and early autumn, and the effect
treatment with emetine upon *Endamoeba histolytica;* an investiga-
on of the value of cultures of material obtained by the duodenal
be in the detection of "carriers" of typhoid and paratyphoid fever
still under way; additional work has been done upon complement
xation in the diagnosis of tuberculosis; the isolation and determi-
tion of the types of pneumococci concerned in the present epidemic
pneumonia is being undertaken; considerable experimental work
s been done upon paratyphoid vaccine; and a little work has been
ne upon the etiology of typhus fever. However, our experience has
own that if research work is to be one of the functions of a depart-
ent laboratory, it will be absolutely necessary to assign enough
rsonnel so that the routine examinations can be made by officers
tailed for that purpose, leaving certain other officers free to devote
eir entire time to research. It is impossible for work of this char-
ter to be done well, and with any expectation of success, if the
ficers engaged in it are continually interrupted by the necessity
making routine examinations.

Publications and reports.—During the time that the laboratory has
en in operation a special report upon the occurrence of endamoebic
sentery in the troops stationed at El Paso has been prepared and
rwarded, as well as one upon the detection of "carriers" of typhoid
d paratyphoid fever by cultures of bile obtained with the duodenal
be, the former by the officer in charge, and the latter by Maj.
enry J. Nichols, Medical Corps, United States Army. In addition
e following papers have been prepared for publication:

1. Alkaline treatment of early gall-bladder carriers with observa-
ons on their detection by aid of the duodenal tube. By Maj. H. J.
ichols, Medical Corps, United States Army. To be published in
urnal of the American Medical Association.

2. The classification of the parasitic ameba of man. By Maj.
harles F. Craig, Medical Corps, Unitrd States Army. Published in
e Journal of Medical Research, January, 1917.

3. The practical application of the Wassermann test in the diag-
sis and as a control of the treatment of syphilis. By Maj. Charles
Craig, Medical Corps, United States Army. Published in the
merican Journal of Syphilis, January, 1917.

4. The complement fixation test in the diagnosis of tuberculosis.
y Maj. Charles F. Craig, Medical Corps, United States Army. To be
ublished in the Journal of the American Medical Association.

Equipment.—The laboratory is well equipped for the work it is
lled upon to do and for research work. Every request for equip-
ent has been promptly granted and most of the equipment has
en received and installed. The rooms occupied by the laboratory
swer the purpose very well, but if it is intended that this labora-
ry become a permanent institution for this district, a suitable

building should be erected near Base Hospital No. 2, on the For Bliss Reservation, both as a matter of economy and of efficiency, a a very large part of the material sent the laboratory for examinatio would come from the base hospital. It would also be much bette from a research standpoint, as clinical material would be near a hand and could be utilized to much better advantage. Howeve if such a change should be made, it is believed that the present statu of the laboratory should remain as it is, i. e., a separate comman directly under department headquarters.

It is recommended that measures be taken to give laborator assistants who have qualified in their duties to the satisfaction of th officer in charge of the individual laboratory a rating for addition pay of $5 a month, as in the case of surgical assistants. Althoug dispensary assistants now have a rating for additional pay of $2 pe month, nurses a rating of $3 per month, and surgical assistants $5 per month, the national-defense act provided for no rating fo additional pay for laboratory assistants, a manifest injustice to very deserving class of enlisted men in the Medical Departmen A good laboratory assistant must possess a large amount of technic scientific knowledge and the duties are very arduous and the hou long, so that it is believed that these men should receive extra pa because of the character of their work. At the present time there no inducement for men to enter the Army laboratories as assistant and the consequence is that we often have to content ourselv with inferior service when much better service could be obtained the assistants received special ratings for additional pay while o duty in laboratories. It is hoped that some method may be worke out that will give the laboratory assistant the same consideratio now accorded dispensary, nurses, and surgical assistants.

In closing this report I desire to call attention to the very efficie assistance rendered by Maj. Henry J. Nichols, Medical Corps, Unite States Army and Capt. Felix R. Hill, Medical Corps, United Stat Army, during the period that they have been on duty in th laboratory.

No.	Rank.	Company.	Regiment or corps.	Station.	Date of diagnosis.	Method of diagnosis.	Prophylaxis.
1	Second lieutenant		Quartermaster Corps	Mexico	Aug. 17, 1916	Agglutination	No data.

DEPARTMENT LABORATORY NO. 3, NOGALES, ARIZ.

LABORATORY BUILDING AND EQUIPMENT.

The laboratory occupies a separate building on land leased from the town of Nogales, in proximity to Base Hospital No. 5. Construction of the building began on August 20, 1916, and the building was turned over for occupancy on September 16, 1916. Construction was supervised by Maj. Edward B. Vedder, Medical Corps, who materially altered the original plans of Maj. Clarence Le R. Cole, Medical Corps. Although the original plan was admirable, it is believed that the changes made by Maj. Vedder added greatly to the convenience and usefulness of the building.

The total cost of the building was $3,500. It is a frame structure 28 by 50 feet, with porches on three sides, and conforms generally to the type of building used in the construction of Base Hospital No. 5. On the main floor there are six rooms—a record office where the clerical work is done; two combined offices and workrooms for the director and his assistant; a large bacteriological laboratory; a commodious laboratory for chemical and pathological work; and a dust-proof room, finished in white enamel, which is equipped for the preparation of vaccines, careful animal work, and other procedures requiring absolutely aseptic technic.

Advantage was taken of the sloping terrain on which the laboratory stands and otherwise waste space beneath the building was utilized for a commodious preparation room in which sterilizers, electric water heater, water still, toilets, and apparatus for the preparation and sterilization of culture media are installed and, leading from this room, a storeroom and animal room, both of which are most conveniently arranged. A dumb-waiter connects the preparation room with the laboratories on the main floor. This arrangement makes possible the segregation of the various laboratory activities so that dust and dirt, leading to annoying contaminations of cultures and media, are reduced to a minimum.

The interior finish on the main floor is tongue-and-groove Oregon pine ceiling. The tops of laboratory benches are of 2½-inch sugar pine, finished with a black, acid-proof stain. Drawers and cupboards are built in beneath the benches at convenient intervals. The building is lighted by electricity, and power plugs are placed at intervals for incubators, centrifuges, and other apparatus operated by electricity. An electric centrifuge and shaking machine are mounted on a solid concrete pillar extending to the ground, which obviates vibration and noise. The building is supplied with gas for the operation of Bunsen burners, sterilizers, and other gas-heated apparatus. Windows and doors are screened throughout. The plumbing consists of three laboratory sinks, two lavatories, and two toilets. Hot water is furnished by an electric heater connected with a 30-gallon tank.

The laboratory equipment is new throughout, most complete, and exceedingly satisfactory in every way. The promptness and facility with which requisitions for apparatus and supplies have been approved offers most gratifying evidence of the policy of the Surgeon General's Office to encourage scientific work.

LABORATORY PERSONNEL.

The laboratory personnel consists of Capt. George B. Foster, jr., Medical Corps; Capt. William B. Meister, Medical Corps; two sergeants and three privates, first class, Medical Department. Capt. Foster relieved Maj. Edward B. Vedder, Medical Corps, upon the latter's return to the Army Medical School, September 23, 1916, and Capt. Meister reported for duty on September 28, 1916.

SCOPE OF LABORATORY WORK.

The first laboratory work was performed during the latter part of September and consisted of routine clinical laboratory examinations of material from Base Hospital No. 5. The functions of a department laboratory, serving Base Hospital No. 5, Nogales, Ariz; the camp hospital at Douglas, Ariz.; the post hospital, Fort Huachuca, Ariz.; and the various troops of the Arizona district in the field, were assumed on October 4, 1916. During the slightly over three months that the laboratory has been in operation 4,018 examinations have been reported as summarized below:

Summary of clinical laboratory examinations, Department Laboratory No. 3.

Blood:		
For malaria		191
Positive	19	
Negative	172	
Leucocyte counts		218
Erythrocyte counts		51
Differential leucocyte counts		170
Hemoglobin estimations		31
Blood cultures, miscellaneous		25
Sputum:		
For tubercle bacilli		234
Positive	9	
Negative	225	
For other organisms		95
Urine:		
Chemical analyses		445
Microscopical examinations		42
Feces:		
For parasites and ova		15
For occult blood		
Stomach contents, chemical analyses of		
Spinal fluid:		
Cell counts		
For meningococci		1
Positive	7	
Negative	10	
Throat cultures for diphtheria		13
Positive	1	
Negative	135	
Cultures of pus, exudates, etc		12
Urethra smears for gonococci		57
Histological examinations of tissues		1
Autogenous vaccines prepared		
Water:		
Bacteriological examinations		
Chemical analyses		
Animal inoculations		4
For diagnosis	6	
For immune sera, etc	43	
Dark-field examinations for treponema pallidum		

Typhoid and paratyphoid examinations:			
Suspected cases examined			90
Positive for B. typhoid, 3; B. paratyphoid A, 1; B. paratyphoid B, 2. Negative for B. typhoid, 87; B. paratyphoid A, 89; B. paratyphoid B, 88.			
Convalescents examined			29
Positive for B. typhoid, 0; B. paratyphoid A, 0; B. paratyphoid B, 0. Negative for B. typhoid, 29; B. paratyphoid A, 29; B. paratyphoid B, 29.			
Suspected carriers or contacts examined			15
Positive for B. typhoid, 0; B. paratyphoid A, 0; B. paratyphoid B, 1. Negative for B. typhoid, 15; B. paratyphoid A, 15; B. paratyphoid B, 14.			
Agglutination tests			16
Positive for B. typhoid, 1; B. paratyphoid A, 0; B. paratyphoid B, 2. Negative for B. typhoid, 15; B. paratyphoid A, 16; B. paratyphoid B, 14.			
Blood cultures			57
Positive for B. typhoid, 1; B. paratyphoid A, 1; B. paratyphoid B, 1. Negative for B. typhoid, 56; B. paratyphoid A, 56; B. paratyphoid B, 56.			
Feces			58
Positive for B. typhoid, 2; B. paratyphoid A, 1; B. paratyphoid B, 2. Negative for B. typhoid, 56; B. paratyphoid A, 57; B. paratyphoid B, 56.			
Urine			14
Positive for B. typhoid, 0; B. paratyphoid A, 0; B. paratyphoid B, 0. Negative for B. typhoid, 14; B. paratyphoid A, 14; B. paratyphoid B, 14.			
Dysenteries, examinations of feces for			27
Bacillary types		9	
Positive	0		
Negative	9		
Entamebic type		18	
Positive	12		
Negative	6		
Gonococcus fixation tests			49
Wassermann tests			807
Positive		160	
Negative		647	
Reexaminations		154	
Autopsies			14
Examinations of suspected narcotics, foods, beverages, etc			5
Miscellaneous examinations not otherwise listed			10
Total examinations for the period			4,018

Analysis of the above data shows that the work of a laboratory of this sort covers a large field, embracing bacteriology, pathology, chemistry, parasitology, serology, and immunology. The relatively large number of clinical laboratory examinations is explained by the fact that this laboratory functions not only as a department laboratory but as the clinical laboratory of Base Hospital No. 5 as well.

It is believed that the functions of a diagnostic laboratory have been fulfilled satisfactorily. This assumption is based upon very gratifying replies to a circular letter from the laboratory requesting information as to the character of the service and inviting constructive criticism. The replies expressed general satisfaction with the service.

An endeavor has been made to cooperate with the district sanitary inspector by reporting immediately all positive findings in infectious diseases, thus enabling him to institute preventive measures without delay. An investigation for the detection of typhoid carriers was made in Company E, First California Field Artillery, and the detachment Medical Department, Second Idaho Infantry. This investigation resulted in the isolation of *B. paratyphosus* from the feces of soldier of the Idaho organization who gave a history of a continue fever, diagnosed clinically as typhoid, in 1900. His mother an sister contracted the same fever, apparently by contact, during th illness of the soldier. There was no history of known subsequen contact infections. The history in this case may be reconciled t the bacteriological findings if we assume that the illness in 1900 wa paratyphoid fever, simulating typhoid clinically, and that since tha date the soldier has been a paratyphoid carrier. An investigation o meningitis contacts has just been completed, as reported in detai below.

INFECTIOUS DISEASES.

Typhoid and paratyphoid infections.—Three cases of typhoid feve were diagnosed during October, but no cases have been detecte since that time. One case was a soldier of the Fifth New Jerse Infantry, stationed at Douglas, Ariz., and the remaining two case occurred in Battery E, First California Field Artillery, and th detachment Medical Department, Second Idaho Infantry, respec tively, stationed at Nogales, Ariz. The typhoid bacillus was isolate from the blood and feces in two of the cases and from the fece alone in one case. The bacteriological diagnoses made by this lab oratory were confirmed at the Army Medical School.

Paratyphoid infections were diagnosed bacteriologically in thre cases. Two of these infections were due to *B. paratyphosus* B an one case was of the paratyphoid A type. The large number of re quests for typhoid-paratyphoid examinations indicate that medica officers are exercising every effort to avoid missing mild and atypica cases, and it seems safe to assume that no typhoid or paratyphoi infections have escaped detection.

Dysenteries.—Entamebic dysentery has been encountered in 1 cases. The histories point to the infections having been contracte locally in the majority of the cases. The disease is endemic here a in most other sections of the country. No case of bacillary dysenter has been seen.

Malaria.—A diagnosis of malaria has been made in 17 cases. On case was of the estivo-autumnal type, the remainder being tertiar Seven of the cases have occurred recently among the Alabama troop and represent recurrences of latent infections. The 10 earlier case occurred principally among northern troops and were undoubtedl contracted here. Malaria occurs at all seasons of the year in thi vicinity.

Cerebrospinal meningitis of the epidemic type has been encountere twice. One case was from the District of Columbia Signal Corps an the other from the Sixth United States Field Artillery. Both ende in recovery as a result of early diagnosis by lumbar puncture an repeated intraspinal injections of antimeningitis serum. At the r quest of Lieut. Col. Bratton, Medical Corps, 128 contacts were exam ined in the organizations from which these cases came. The secre tions collected on swabs from the posterior nares and nasopharyn were emulsified in sterile distilled water, and blood-agar plates wer prepared from each emulsion. After 24 hours' incubation, coloni that resembled those of meningococci were fished and stained by Gram's method. Colonies showing Gram-negative diplococci were then subcultured on Hiss's serum-water media, containing lactose, saccharose, dextrose, and maltose. Gram-negative diplococci, morphologically indistinguishable from the meningococcus, were isolated in a number of cases, but in no instance did these organisms fulfill the requirements of the meningococcus by fermenting dextrose and maltose without acidulation of the other saccharides.

Diphtheria has been diagnosed in one instance only. It is believed that very few, if any, cases have escaped detection, as cultures are made routinely at Base Hospital No. 5 in all cases of sore throat.

Anthrax.—One case of anthrax occurred in the First Alabama Infantry. The clinical diagnosis was cellulitis of the face. Anthrax bacilli were demonstrated in smears and *B. anthracis* was isolated from the lesion in pure culture. Recovery followed radical excision of the malignant pustule and treatment with Sclavo's serum.

Acute respiratory infections have given most concern to the sanitary inspectors since the onset of cold weather. As most of these infections were diagnosed as influenza, a bacteriological investigation was requested by Col. Bratton. A series of about 20 cases were selected at random and cultures of the sputum, collected in sterile bottles, were made on streaked blood-agar plates. *B. influenzæ* was demonstrable in one-third of the cases, but never in predominating numbers. The pneumococcus, micrococcus catarrhalis, streptococcus viridans, and various hemolytic streptococci were found more frequently than *B. influenzæ* and in infinitely greater numbers. These findings are in accord with those of various investigators in large cities throughout the country during the epidemics of grip during the winter of 1915–16.

Recently pneumonia has been prevalent, especially among the Alabama troops. Autopsies on fatal cases have shown the lesions of typical lobar pneumonia. Cases of the broncho-pneumonic type have not been encountered. The fact that pneumonia is largely confined to the Alabama troops suggests some predisposing cause that is not common to the other troops. The thought has occurred, and Col. Bratton has held to this opinion from the start, that latent malaria and hookworm infections, by sapping the normal powers of resistance to infection, may be important factors. The preliminary laboratory results support this contention. The number of pneumonia cases in which the feces have been examined is small, but the fact that 88 per cent of these show hookworm infection, while only 20 per cent of the same soldiers admitted with other conditions have been shown to harbor the parasite, is suggestive at least that the investigation of a large number of cases will give credence to the contention. From now on the feces of all Alabama soldiers admitted to hospital will be examined for hookworm and a control series of a squad from each company of the three regiments will be examined simultaneously.

WASSERMANN REACTION.

The technic of the Wassermann test as performed in this laboratory is identical with that used at the Army Medical School by Maj. Edward B. Vedder, Medical Corps. Were convention to be followed a report of this sort should contain a lengthy discussion of the merits of the test, bolstered by an array of statistics. It is felt that this is

no longer necessary. The Wassermann test as standardized b
Maj. Vedder is thoroughly reliable as a diagnostic test and that i
value is appreciated by medical officers throughout the service
attested by the place it has taken as a routine diagnostic procedur
A Wassermann test is required by orders at the camp hospital
Douglas on every case admitted, and it is a routine procedure
some of the wards of Base Hospital No. 5. This has resulted in
large number of negative reports, but these have been of value
eliminating syphilis in many cases. Very frequently much ligl
has been thrown upon obscure medical and surgical cases by a pos
tive Wassermann reaction. This test should take its place, alor
with the urinalysis and blood pressure reading, in every thorough
worked up case.

SUPPLIES ISSUED.

Many requests have been received from the stations served
this laboratory for stock vaccines, culture media, mailing case
etc., as contemplated by Circular 51, department surgeon's offic
Southern Department, August 12, 1916. These requisitions ha
been filled upon the day of receipt. In addition to the supplies co
templated in the circular quoted, a supply of biological product
including antimeningitis serum, antitetanic serum, antidiphther
serum, and Sclavo's antianthrax serum have been kept in stoc
This rather unusual procedure has been necessitated because of t
meager stock of these products carried by local dealers and the d
lay occasioned by obtaining them from a distance when cases ari
requiring their use.

NEEDS AND RECOMMENDATIONS.

The laboratory is splendidly equipped to do not only the diagnost
work required of it, but to expend its activities so as to embra
more investigative work.

It is understood that plans for contonments at Nogales, Dougl
Naco, and Yuma have been approved, which indicates that troo
will be in this district indefinitely. In the event of military ope
tions in Mexico, this laboratory could serve not only this base, b
is situated on a railroad extending from Nogales to Guaymas on t
Gulf of California and could handle with dispatch the work of t
line of communications. The building is sufficiently commodio
to accommodate double the personnel now on duty and expansi
simply resolves itself into a question of increase in personnel.

Situated as it is, with a large hospital at its door, much time th
could otherwise and should be devoted to investigative work
occupied with routine clinical laboratory examinations. T
routine work is of the highest importance; but, on the other har
many valuable opportunities to investigate the cause and modes
transmission of infectious diseases are lost because of lack of tin
It is recommended that an officer of the recently created resear
division of the Medical Corps be detailed at this laboratory in ad
tion to the personnel now allotted.

As regards enlisted personnel an experienced sergeant, first cla
is urgently needed. This detail would relieve the officer in char
of much clerical work that now infringes upon days filled with ot
duties.

A matter that should receive departmental consideration is the uestion of extra pay for enlisted laboratory assistants such as is ow available for enlisted dispensary, surgical, and dental assistants nd wardmasters. The work required of laboratory assistants, at ast in this laboratory, entails longer hours of duty than that of ie other classes mentioned and an equally high degree of skilll nd training. It is only equitable that they should receive extra noluments for their extra efforts.

A few minor additions to the laboratory building are necessary, ich as ceiling the preparation room and animal room in conformity ith the rest of the building. The necessity for this is shown in the hotograph which accompanies this report. A cold room for the orage of media and biological products is also desired. Estimates r the construction of these items will be forwarded at the proper me.

Capt. George B. Foster, Medical Corps, reports on Rosenow antigen eatment of pneumonia as follows:

> 1. At the request of the commanding officer, Base Hospital No. 5, I have carefully vestigated the advisability of using the Rosenow method of treating pneumonia ith specific antigens and, after going over the matter with Capt. Flynn, who is eating most of the cases, we have come to the conclusion that the method has no lvantages over the treatment now in vogue at the hospital.
>
> 2. Eighty-eight cases of pneumonia have been admitted to date and 12 of these ive died, establishing a death rate of 13.6 per cent. The death rate shown by Roseow in a series of cases comparable to ours in age—namely, 21 to 30 years—is 18 per nt. In his control series not treated specifically the death rate was 22.2 per cent. will be seen that the difference in the percentages is not great and that our death te here is considerably lower than in his series of specifically treated cases. Furermore, although Rosenow instituted this specific treatment in 1911 and has reported s results at various times since then, I am unable to find favorable results with this eatment reported by others. Finally, the technic required for the preparation of ese antigens is complicated and time consuming and, although the laboratory is epared to carry on the work, if you desire it, it is believed that the time required n be spent much more profitably on other work.
>
> 3. I feel that this explanation is due your office and that of the department suron, as through your efforts and the prompt action of the department surgeon's office additional medical officer, Capt. Wilde, has been detailed for duty here.
>
> 4. Although Capt. Wilde has been on duty a few days only, I believe he will prove be a most valuable acquisition. He seems to have the necessary enthusiasm, is tentive to duty, and interested in his work, and I hope that it may be arranged r him to remain here permanently.

HOOKWORM SURVEY—SICK IN HOSPITAL.

1. The following results have been obtained in the hookworm irvey of Alabama soldiers admitted to Base Hospital No. 5 to date:

Diagnosis.	Total examinations.	Positive.	Negative.	Per cent positive.
				Per cent.
ieumonia	50	25	25	50
fluenza	41	9	32	21.9
onchitis	18	9	9	50
nsillitis	21	9	12	42.8
idetermined	11	3	8	27.2
l other conditions	53	7	46	13.2

tal examinations of all conditions	194
tal showing hookworm	62
rcentage of cases positive.....per cent	31.9

Lieut. Col. T. S. Bratton, Medical Corps, reports on the sickness c
Alabama troops as follows:

In view of the statements made by Capt. Foster the Rosenow treatment will n
be used, but it is proposed to use the laboratory to help eradicate hookworm di
ease in the Alabama troops, for I am convinced that the lowered resistance show
by these troops is, in a great measure, due to the presence of hookworm disease in
large percentage of the troops.

This matter of hookworm disease in the Alabama troops was first impressed on m
at the maneuvers at Manassas in 1904, and when they arrived at this station I directe
the attention of the medical officers of the hospital and laboratory to this fact, in a
informal way. The laboratory has found a large per cent of the sick suffering fro
the hookworm infection. Of 50 cases of pneumonia 25 showed hookworm. Th
First Alabama Infantry, which shows by far the greatest number of pneumonia
came from the lower part of Alabama, where the soil is sandy and where the infectio
is quite prevalent. Therefore I think the solution of the sickness in the Alabam
troops is to eradicate the hookworm infection, and with the laboratory to help we wi
institute a vigorous campaign along that line, but we will need considerable thym
etc., and to hasten and facilitate our work it is requested that the requisition for th
base hospital, herewith inclosed, be furnished at once. I will see that it is distribute
to the different organizations from the base hospital as they require it.

A table prepared by Capt. Foster, showing the prevalence of hookworm disease i
the troops, is inclosed.

MEDICAL DEPARTMENT.

The following statement shows the strength of the personnel ommissioned, enlisted, and employed by contract or otherwise, of ie Medical Department on June 30, 1917.

edical officers	489
pproved Medical Corps candidates awaiting confirmation	39
edical reserve officers, active duty	3,636
ontract surgeons	9
ental surgeons, commissioned	86
eterinarians, commissioned	57
rmy Nurse Corps	259
rmy Nurse Corps reserve on active duty	917
edical Department, enlisted personnel	16,773
ivilian employees, Medical Department at large	934
Total medical personnel	23,199

MEDICAL CORPS.

The Medical Corps is composed of the commissioned medical officers f the Regular Army:

uthorized strength June 30, 1917	2,100
service June 30, 1916	443
eappointed as captain	1
ppointed to June 30, 1917	58
Total	502
osses during the year	13
In service June 30, 1917	489

On October 16, 1916, 65 candidates who had passed the preliminary xamination for appointment in the Medical Corps reported at ashington to take the course of instruction at the Army Medical chool. Fifty-eight successfully completed the course of instruction t the school and were graduated March 3, 1917, and recommended r appointment in the Medical Corps of the Army.

On March 14, 1917, 49 candidates who had passed the preliminary xamination reported at the Army Medical School for the required ourse of instruction. Of these 41 successfully completed the course nd were graduated May 31, 1917. Thirty-nine of them were recom-ended for appointment in the Medical Corps of the Army, but so r have not been confirmed, thereby making the gain by appointment ly 58.

Losses during the fiscal year.

	Lieutenant colonel.	Major.	Captain.	Total.
Died	2		2	
Retired		3		
Resigned			5	
Wholly retired			1	
Aggregate	2	3	8	

The following promotions were made up to June 30, 1917: Nin lieutenant colonel 75 captains to be majors, 16 lieutenants to be captains.

The department held eight preliminary examinations for appoin ment in the Medical Corps. The dates and the results of thes examinations are tabulated below:

Date.	Invited.	Declined.	Fail to appear.	Examined.	Physical disability.	Withdrawn.	Rejected.	Qualifie
July 17, 1916	106	22	11	73	3		35	
Aug. 14, 1916	83	8	18	57	7		28	
Sept. 5, 1916	38	3	4	31	3	1	19	
Jan. 2, 1917	116	17	17	82	7		39	
Feb. 5, 1917	53	2	9	42	1	2	16	
Apr. 2, 1917	15			15	2		9	
May 7, 1917	71	4	8	59	3		20	
June 4, 1917	376		120	256	29	2	105	
Total	858	56	187	615	55	5	291	

Seven qualified applicants were left over from last year, making total of 291. Of these 65 entered the school in October and 49 March. Another class is to begin in July, 75 going to the Arn Medical School and 90 to the training camp at Fort Benjam Harrison, a special ruling permitting those who successfully pass t course to be appointed in the Medical Corps, and examinations a being held on the first Monday of each month.

MEDICAL OFFICERS' RESERVE CORPS.

The Medical Reserve Corps went out of existence on June 3, 191 by operation of law and the Medical Officers' Reserve Corps car into existence. The officers of the old corps, for the most pa transferred to the new, though some were lost by not accepting t new commissions before the old ones expired. Since the new cor provides for increased rank, many men who had been on active du for some time were promoted to captains and majors.

An enormous increase in the personnel of the Medical Office Reserve Corps is in progress. The following figures show the numb of actives and inactives on June 30, 1917:

On roster June 30, 1916	1,
Appointed during year	2,
	4,

Losses during the year:		
Resigned	175	
Discharged	7	
Died	11	
Commissions vacated by appointment to regular corps	58	
		251
On roster June 30, 1917		4,465

Of the 4,465 on roster June 30, 1917, 3,636 were on active duty and 829 on inactive list.

On active duty June 30, 1916		146
Ordered to active duty during year		3,730
		3,876
Relieved from active duty	182	
Commissions vacated	58	
		240
On active duty June 30, 1917		3,636

An officer of the Medical Officers' Reserve Corps residing in the vicinity of each military post has been designated as a locum tenens, and the policy has been adopted of calling such officer into actual service for duty at his post when all the regular medical officers thereat are called upon to accompany troops into the field.

CONTRACT SURGEONS.

In service June 30, 1916	17
Contracts made during year	2
Total	19
Contracts annulled during year	10
Contracts in force June 30, 1917	9

These contract surgeons are on duty at arsenals, remount depots, transports, etc., at $75 or $150 per month, depending upon whether they are on half or full time contracts, respectively.

It is planned to use contract surgeons much more extensively than has been the custom, particularly for short-time or special service and under conditions when it would be impracticable to utilize reserve medical officers.

DENTAL CORPS.

Dental surgeons (first lieutenants) in service June 30, 1916	40
Appointed during the year	48
	88
Retired with grade of captain	2
On duty June 30, 1917	86
Awaiting confirmation	32
Total	118

Acting dental surgeons:		
Number in service June 30, 1916		35
Contracts annulled by acceptance of commission	32	
Contracts annulled	3	
		35
On duty June 30, 1917		0

From February to April, 1917, the acting dental surgeons unde contract were commissioned as first lieutenants in the Dental Corp after examination. Examinations for admission to the Dental Corp were held on July 10, 1916, and May 7, 1917. Of 258 invited 18 reported for examination, and of these 49 were found qualified Seventeen were commissioned in October and 32 have been recommended but not confirmed. Another examination is scheduled fo July 2, for which 460 have been invited.

DENTAL OFFICERS' RESERVE CORPS.

This branch of the Officers' Reserve Corps established by th national defense act, June 3, 1916, is on the verge of rapid growtl Four hundred and ninety-four were recommended prior to June 3(Of these 88 accepted and 20, who were assigned to Red Cross bas hospitals, were on duty June 30. The records are now in such co dition that approximately 3,000 will be recommended within the nex three months.

VETERINARY CORPS.

This is a new branch of the Medical Department established by ac of Congress approved June 3, 1916. There were several examin tions held at odd times for quartermaster veterinarians, beginnin September 10, 1916. Of 67 examined 17 were disqualified and 5 accepted. Of those 5 qualified with the grade of major after 2 years' service, 7 with the grade of captain after 15 years' service, 3 with the grade of first lieutenant, and 7 with the grade of second lie tenant. In the examination held July 17, 1916, for appointment fro civil life 74 were invited, 25 were rejected as above age, 14 failed t appear, 3 withdrew, and 27 were examined. Of these 23 we rejected and 4 were accepted. Three were appointed as second lie tenants from March 17, 1917, as one declined the appointmen Contract veterinarians are now no longer employed.

VETERINARY OFFICERS' RESERVE CORPS.

The veterinary section of the Officers' Reserve Corps was estal lished by the national defense act of June 3, 1916. It is growin rapidly, for 446 veterinarians were recommended as second lieute ants, Veterinary Officers' Reserve Corps, prior to June 30, 1917. C these 85 had accepted and 47 were on active duty.

Enlisted Force of the Medical Department.

Strength at date of last report, June 30, 1916:	
Sergeants first class	3
Sergeants	5
Corporals	
Cooks	1
Privates first class and privates	3, 5
Total	4, 6

Gained July 1, 1916, to June 30, 1917:	
By enlistment	10,892
By reenlistment	162
By transfer from the line	2,410
Returned from desertion	230
Total	13,694
Loss during the same period:	
By order	223
By sentence general court-martial	212
For disability	188
For re-enlistment	159
By transfer to the reserve	70
By retirement	24
By transfer to the line	227
By desertion	398
By death, due to disease	51
By other losses	39
Total	1,591
Leaving in service June 30, 1917:	
Master hospital sergeants	18
Hospital sergeants	24
Sergeants first class	640
Sergeants	899
Corporals	385
Cooks	375
Horseshoers	4
Saddlers	8
Farriers	8
Mechanics	9
Privates first class and privates	14,403
Total	16,773

ARMY NURSE CORPS.

The authorized strength of the Army Nurse Corps for the fiscal year ending June 30, 1917, was for 206 nurses, but the moblization of the Regular troops and militia on the Mexican border having resulted in the establishment of many hospitals at which nurses were needed, an addition of 276 nurses was authorized early in the year to meet the emergency. Nurses were appointed in the regular corps as rapidly as possible, and their number was further augmented by the assignment of a large number from the reserve, the enrolled nurses of the American Red Cross constituting the reserve. During the year, nurses were sent to the following places;

Base Hospital No. 1, Fort Sam Houston, Tex.;
Base Hospital No. 2, Fort Bliss, Tex.;
Base Hospital No. 3, Brownsville, Tex.;
Base Hospital No. 4, Eagle Pass, Tex.;
Base Hospital No. 5, Nogales, Ariz.;
Camp hospital, Deming, N. Mex.;
Camp hospital, Douglas, Ariz.;
Camp hospital, Laredo, Tex.;
Camp hospital, Llano Grande, Tex.;

Camp hospital, McAllen, Tex.;
Camp hospital, Marfa, Tex.;
Cantonment hospital, Columbus, N. Mex.;

and to the hospital train which has its headquarters at Camp Wilson Tex. With the withdrawal of the troops, the work at these place gradually decreased, and nurses were withdrawn from Columbus Llano Grande, McAllen, early in the year, and later on, from Marf and Deming. The quarters provided for the nurses were temporar structures, but comfortably furnished, and in the main, very satisfactory. The maximum number of nurses for service on the borde was 201 on February 28, after that the number decreased as the nee grew less. Shortly after the declaration of war April 6, 1917, plan were made to send six base hospitals to Europe for service with th British forces. The hospitals designated were:

Base Hospital No. 4 of Lakeside Hospital, Cleveland, Ohio.;
Base Hospital No. 5 of Peter Brent Brigham Hospital, Boston Mass.;
Base Hospital No. 2 of Presbyterian Hospital, New York, N. Y.;
Base Hospital No. 10 of Pennsylvania Hospital, Philadelphia, Pa.
Base Hospital No. 12 of Mercy and Wesley Hospital, Chicago, Ill.
Base Hospital No. 21 of Barnes Hospital, St. Louis, Mo.;

with a total of 436 nurses. Two of the nurses attached to Bas Hospital No. 12, Miss Helen Wood and Mrs. Edith Ayres, wer accidentally killed while sitting on the deck of the S. S. *Mongolia* en route to Europe, by fragments of brass which struck them, due t the faulty discharge of a gun on the after deck of the steamer. Mis Emma Matzen attached to the same hospital sustained some injurie which fortunately did not prove to be serious.

The following base hospitals were sent to France for duty with th American Expeditionary Forces:

No. 18, Johns Hopkins, Baltimore, Md.;
No. 6, Massachusetts General Hospital, Boston, Mass.;
No. 15, Roosevelt Hospital, New York, N. Y.;
No. 17, Harper Hospital, Detroit, Mich.;

with a total of 295 nurses. Nurses have also been sent to the following posts:

Fort Myer, Va.;
Madison Barracks, N. Y.;
Plattsburg Barracks, N. Y.;
Fort Snelling, Minn.;
Fort Benjamin Harrison, Ind.;
Fort Ethan Allen, Vt.;
Fort Oglethorpe, Ga.;
Fort McDowell, Cal.;
Mobilization camp, Syracuse, N. Y.

Upon request of the Secretary of War the bureau of immigration o June 13, authorized the use of Island No. 3, Ellis Island, N. Y., fo moblization of members of the Army Nurse Corps ordered abroad Comfortable quarters were provided, accommodating 225 nurses subsistence being furnished at the restaurant on the island, unde contract with the department quartermaster, Eastern Department which arrangement has proved most satisfactory.

During the year 1,853 requests were received for application blanks There were 57 discharges and 154 appointments of the regular corps

,053 reserves nurses were assigned to active duty and 131 relieved. The daily average for the regular corps was 221.97 and for the reserve 99.83, total 421.80. On June 30 there were 259 nurses in the regular corps and 917 reserve nurses on duty, making a total of 1,176 nurses.

Owing to the great increase in the cost of living, the pay of the Army Nurse Corps should be increased to $60 on the first appointment, and allowance for commutation of ration from 40 to 75 cents per day. The rate of 40 cents is entirely inadequate, especially at the smaller tations. For nurses in Europe at least $1 is required. The defining of the status of the members of the Army Nurse Corps is also highly advisable, and while the conferring of actual rank upon them may not be feasible, steps should be taken to give them a definite standing in he Military Establishment. There is also no retirement for the corps, and as nurses have been employed by the Medical Department since 898, a period of 19 years, some provision should be made for them.

ARMY MEDICAL SCHOOL.

Maj. Harold W. Jones, Medical Corps, reported for duty at t school on October 8, 1916, and was assigned to duty as adjutan secretary of the faculty, professor of sanitary tactics, and assista professor of medical department administration.

Col. William O. Owen, Medical Corps, was detailed as profess of medical department administration during the absence on fiel duty of Col. James D. Glennan, Medical Corps, and performed suc duties until relieved by War Department orders, dated March 1917.

Maj. Philip W. Huntington, Medical Corps, was assigned to dut at the school as professor of Roentgenology vice Capt. Arthur Christie, Medical Corps, per War Department orders dated Septen ber 14, 1916.

Maj. Matthew A. Reasoner, Medical Corps, was relieved from dut at the school as assistant professor of bacteriology per War Depar ment orders dated May 28, 1917.

Capt. Corydon G. Snow, Medical Corps, was assigned to duty the school as assistant professor of bacteriology per War Depar ment orders dated September 16, 1916.

First Lieut. Cyrus B. Wood, Medical Corps, was assigned to dut at the school as assistant professor of sanitary chemistry per W Department orders dated March 10, 1917.

The twenty-first session of the school began on October 1, 1916.

Owing to the increase of the Army and the large number of existi and prospective vacancies in the Medical Corps occasioned thereb it was essential that provision be made for the training of mu larger classes than had been previously accommodated. The teachi and laboratory facilities being entirely inadequate at the buildi located at 721 Thirteenth Street NW., a search was begun for larger building, and after considerable difficulty, one apparent meeting the requirements, located at 462 Louisiana Avenue NW was secured. This building was formerly occupied by the offices the District government and later by the Department of Commer It has six stories with about 57,000 square feet of floor space. It very well adapted for teaching and laboratory purposes and accomm dated a class of 75 students. The several floors of the building a utilized by the school as follows:

Sub-basement: Heating and steam plant.

Basement: Animal room, large storeroom, shop for mechani and storeroom for photographic supplies.

First floor: Waiting room, information room and telepho exchange, students' locker room, X-ray and photographic roo library, and small storeroom.

Second floor: Offices of the commandant, adjutant, chief cler faculty room, record room, lecture hall, and eye room.

Third floor: Chemical instruction laboratory, chemical working aboratory, special bacteriological laboratory, writing room for fficers awaiting orders for foreign service, and storeroom.

Fourth floor: Office of assistant professor of bacteriology, physical xamining room, vaccine laboratories, incubators, vaccine preparaion rooms, packing room, vaccine storage refrigerators, and special aboratory.

Fifth floor: Offices of the officer in charge of the bacteriological aboratories and assistant, clerks' office, large students' laboratory, pecial laboratories, and printing room.

Sixth floor: Physical exercise room, which is also used as a physical xamination and written examination room; histological laboratory; rivate office for the use of the chief of the laboratory division, urgeon General's Office, and sleeping rooms for guards and officers hose duties make it necessary for them to remain in the building uring the night.

TWENTY-FIRST SESSION.

First section began October 16, 1916, and ended February 28, 1917.

Second section began March 14, 1917, and ended June 5, 1917.

The number of accepted candidates appointed in the Medical eserve Corps and ordered to the school for instruction was 115. f this number 1 resigned after reporting and before commencing he course, and 1 was relieved from attendance and ordered to his ome by reason of inaptitude before the completion of the course.

No members of the Organized Militia attended either section.

The post-graduate course for officers of the Medical Corps was ot given.

Of the 113 student candidates who completed the course of instrucion, 101 qualified at the final examinations. Of this number 98 ere recommended for commission in the Medical Corps, 1 failing o receive such recommendation because of deficiency in general ptitude for the military service, and 2 by reason of physical disualifications.

The third section of the twenty-first session will commence ometime during the month of July.

A report of the Army Medical School would be entirely inadequate f it did not include a summary of the large fields of activity in which t is engaged aside from its function as a teaching institution.

Its activities are summarized as follows:

During the year just closed the mobilization of practically the ntire National Guard, the increase in the Regular Army and Navy, he requirement that paratyphoid vaccine be administered to all hose in the military service, and the preparations for the mobilizaion of the National Army have required an enormous production f vaccine. Had the school remained in the building formerly ccupied by it the demands of the service could not have been uccessfully met. The production of vaccines has gone forward ithout delay which reflects great credit on the officers and enlisted en engaged in that work. Not only has the quantity produced een adequate at all times, but the requirements for additional lassware, new laboratory installations and apparatus, have been et with no interruption and vaccines have been packed and shipped, so far as practicable, within 24 hours after receipt at the school (the requests. As many as 57 shipments have been made in one da The cost value of the vaccines manufactured at this school durin the year was approximately $240,000. For the commercial vaccin this represents a retail market value of $1,200,000, a saving to t Government of approximately $960,000.

Numerous improvements have been made in the vaccine roon including the installation of large refrigerators, a mammoth inc bator, etc.

There were 6,701 Wassermann reactions performed during t past year. This at ordinary commercial rates of $5 per test woul have cost the Government $33,505.

A liberal estimate of the cost of this work, including the salaries one major and one sergeant, is only $6,364.

This item alone represents a saving to the Government of $27,14

Work in the chemical laboratory has been conducted along routi and well established lines.

The X-ray laboratory has been greatly enlarged, new apparat installed, and a photographic room added. In addition to the teac ing work, this department has done a large amount of work for t officers and enlisted men and their families stationed in and ne Washington. These patients were sent here by the attending surgeo

The large amount of X-ray work required by St. Elizabeths Ho pital was also done here.

A large amount of photographic negatives of general subject lantern slides, and microphotographs were made.

An X-ray technician, who is an electrical mechanical expert, ca ried on the roll of civilian employees, has recently been assigned this department, and his services are available for installation a repair work at any military establishment of the Army.

A very important function of the school is the making of physic examinations of officers for promotion and of applicants for appoin ment in the various Reserve Corps sections of the Army, etc. T amount of time consumed and the labor involved by having the examinations made by one officer, the uncertainties connected wi the performance of this work, and the constant changes in deta for the various examining boards made it advisable to inaugurate system, which examinations could be made systematically and t records secured against loss. At the present time the services from 5 to 10 officers of the Medical Reserve Corps who are awaiti orders for foreign service are utilized in physical examination wor By this plan fully 50 to 60 physical examinations may be made dai without confusion. At the close of the day the physical examinati forms, properly filled in, are delivered to the office of the adjuta and in order to guard against error, are carefully gone over befo being forwarded to the proper office. During the two and one-h months from April 15 to June 30, approximately 1,000 examinatio were made, with a constant increase in the daily number toward t close of the period of this report. If necessary, the school can hand 100 physical examinations a day without serious difficulty.

About the middle of May it became necessary for the War Depa ment to send a large number of Medical Reserve Corps officers foreign service, and since that date 198 reported at this school f instructions. The school assumed entire charge of them, gave the nstructions as to uniform, equipment, money affairs, etc.; vacciated them against typhoid fever, paratyphoid fevers A and B, and mallpox; made physical examinations of each; reported them ready or orders; furnished them with true copies of same; and gave them inal instructions regarding their departure and arrival at New York or duty on the other side of the Atlantic in compliance therewith. he handling of this work necessitated the establishment of what night be termed a "Foreign Service Bureau" and involved a great ncrease in the clerical work of the school. The system of handling hese officers has been very successful and will probably be continued s long as there is need for it.

An important function of the school is the printing of a vary large mount of material, not only for its own use, but for the office of the Surgeon General. Formerly an ordinary multigraph was used, but t was found that the amount of printing had increased to such an xtent that two or three of these machines with an equal number of perators would be required to meet the demands; accordingly an lectric-driven mimeograph was installed, and up to this time this nachine, with the multigraph, has proved adequate. During the year the total number of prints made was 652,163, including 18,045 heets of questions for the several examinations of applicants for ppointment in the Medical Corps, Medical Reserve Corps, Veterinary Corps, etc., which involved the folding of these sheets and the sealing of 20,604 envelopes.

During the year the school was charged with the arrangements for and the handling of the details in connection with furnishing medical officers assigned as special lectures at medical schools throughout the country with moving-picture films and lantern slides for use as llustrations for their talks. For this purpose five large moving-picture films illustrating the activities of the Medical Department in the field were sent to the school. Correspondence was kept up with the officers concerned and the itinerary was drawn up. The films and slides were sent by express to various points throughout the country, including New York, Philadelphia, Baltimore, St. Louis, Omaha, Columbus, Buffalo, Syracuse, and other cities. A considerable amount of correspondence was made necessary in the handling of this matter owing to the complications arising from the numerous and sometimes insistent demands from different officers for the use of these illustrations on the same date at widely separated localities. Every effort was made to satisfy all individuals concerned, keeping in mind the desirability of having these pictures shown in the large cities first.

ACTIVITIES, NOT DIRECTLY CONNECTED WITH THE SCHOOL, OF MEMBERS OF THE FACULTY.

Most of the members of the faculty have had many duties which were not strictly connected with their teaching positions assigned to them.

The commandant, Col. William H. Arthur, Medical Corps:

Col. Arthur was detailed as a member of the following boards: Army medical board, per War Department orders dated July 3, 1915; examination of retired officers of Medical Corps for fitness to transfer to active list, per War Department orders dated October 23, 1915;

Army retiring board, per War Department orders dated January 1916; medical officers for promotion, per War Department orde dated February 21, 1916; board of review, per War Departme orders dated May 18, 1916; preliminary examining board, per W Department orders dated May 26, 1916; examining board for pr motion, per War Department orders dated June 17, 1916; supply National Guard and Volunteers, per War Department orders date July 31, 1916; examining board for promotion, per War Departme orders dated August 23, 1916; retiring board, per War Departme orders dated August 31, 1916; selection of majors, captains, a first lieutenants for medical section of Officers' Reserve Corps, p War Department orders dated September 21, 1916; prelimina examining board, per War Department orders dated October 1 1916; examining board for promotion, per War Department orde dated March 2, 1917; and Army retiring board, per War Departme orders dated June 25, 1917.

The adjutant, Maj. Harold W. Jones, Medical Corps:

Maj. Jones was detailed as a member of the general motor boa working in conjunction with the truck standardization division of t American Association of Automobile Engineers and continued on th work during the year in connection with the Master Car Builders America and under the direction of Col. Chauncey B. Baker of t Quartermaster General's Office.

He also prepared the plans and specifications for the conversi of railway coaches and cars into hospital trains. This work was con pleted and a sample train constructed by the Pennsylvania Railroa Co., the plans finally receiving the approval of the Surgeon General Office.

He was detailed a member of the ambulance board and in this co nection made several trips to the Ford factory at Detroit and the Babcock Manufacturing Co.'s works in Watertown, N. Y. T work of the ambulance board has taken a great deal of the time of a members, as it involves the passing upon of every appliance used the transportation of the sick, and makes necessary investigations ambulance bodies, materials, automobile accessories, litter carrier the making of automobile tests, etc.

During October, 1916, Maj. Jones was detailed to go to Philade phia and prepare a site for the base hospital encampment in Frankl Park. This involved the setting up of more than 100 tents, 30 of the the large ward tents; the flooring of many of these, and the install tion of electric lights and water; the placing of more than 50 tons hospital supplies, beds and bedding, etc.; and the caring for a hospit personnel of 65. This entire work was accomplished in eight worki days with five sergeants, first class, and 30 privates from the Walt Reed General Hospital, and involved the expenditure of nearly $3,00 which was provided by the Red Cross. It is estimated that betwe 50,000 and 60,000 people saw the camp, which was the first mobiliz tion of a Red Cross base hospital in the history of the country.

In addition, the editing of the new Manual of Sanitary Drill Reg lations was turned over to Maj. Jones, and this work, under his dire tion, was very ably performed by First Lieut. Raymond W. Whittie Medical Reserve Corps., assistant professor of sanitary tactics.

Professor of Röntgenology, Maj. Philip W. Huntington, Medic Corps:

In addition to his regular duties, Maj. Huntington served as a ember of various examining boards; attended the conference of öntgenologists in New York City; and made various inspections X-ray equipments.

He also delivered a course of lectures on military medicine and rgery and camp sanitation at the Cornell Medical School with very ccessful results.

The following exhibits the course of instruction, names of the rofessors and assistant professors, the value given to each subject, nd the number of lectures or hours of instruction:

MILITARY SURGERY.

Col. William H. Arthur, Medical Corps, professor.

Value of subject: Maximum, 800; minimum, 640.

The course consisted of didactic lectures on gunshot, sword, aber, and bayonet wounds, illustrated by lantern slides, skiagraphs, nd pathological specimens. It embraced the mechanics of projec-les; the different kinds of projectiles used in modern warfare; their fects upon the various tissues and organs of the body at different anges; complications; the action of explosives on tissues; the treat-ent of gunshot wounds and their complications on the battle field nd at field and base hospitals; etiology, signs, symptoms, and treat-ent of traumatic aneurisms; varieties of wounds produced by cut-ng and puncturing weapons, and their treatment; wound infections, nd their treatment; and statistics of battles and campaigns. Twenty ine hours were devoted to instruction in this subject.

MEDICAL DEPARTMENT ADMINSITRATION.

Col. James D. Glennan, Medical Corps, professor; Col. William O. wen, Medical Corps, professor; Maj. Harold W. Jones, Medical orps, assistant professor.

Value of subject: Maximum, 800; minimum, 640.

The course included Army Regulations; the Manual for the Medical epartment; customs of the service; all general orders, circulars, and ulletins; and methods of administration, with all blank forms in rce.

Organization of the Army; territorial departments and tactical ivisions; organizations and duties of each corps and staff department; ilitary rank, command, and precedence; military discipline, honors, eremonies, official, semiofficial, and personal courtesies and customs.

Laws and regulations in regard to the appointment of cadets and fficers; promotion, retirement, and resignation of officers; death and urial of officers; personal and efficiency reports; method of obtaining ay, quarters, and all allowances of every kind under each staff de-artment with all blank forms used.

General recruiting service and methods of enlisting at stations, ith all circulars, reports and forms.

Descriptive lists, methods of muster and pay, drawing and issuing lothing and keeping accounts, discharges and final statements, all llowances of every kind under all departments and all blank forms sed.

All laws, regulations, orders, and methods concerning the Hospital orps and the Army Nurse Corps.

Regulations.—Visual and other physical standards for admission the United States Military Academy; commissions in line or staff the Army, promotion from the ranks, reenlistments, and promotio

Annual physical examination of officers and tests of field officer duties of medical officers on all boards of examination, promotio and retirement, with all examination forms.

Laws, rules, regulations, and methods governing vaccinatio typhoid prophylaxis, and venereal prophylaxis, with all blank forn used.

Military correspondence, form of letter writing, and methods recording and filing in use in the service.

Rations.—Methods of drawing rations or commutation therefc and use of the ration under all conditions; purchase; hospital fun its use, care, and returns; mess management.

Post administration.—Duties of medical officers, sanitary inspe tions and reports, sick call, morning reports, post hospital, and ge eral hospital administration.

Methods of keeping register of sick and wounded.—Reports, pape and methods connected therewith, and all forms.

Morbidity and mortality rates.

Property.—Allowances, methods of obtaining, caring for, usin accounting for, and disposing of property of all departments, and forms connected therewith.

Methods of purchasing necessary supplies and of having laund work done.

Forty-six hours devoted to instruction in this course.

MILITARY HYGIENE.

Lieut. Col. Champe C. McCulloch, jr., Medical Corps, professor.

Value of subject.—Maximum, 800; minimum, 640.

The course was unavoidably modified in many respects, owing the fact that three short sessions instead of one long one are bei held. Formerly the instruction was mainly by lectures, suppl mented by the quiz. This year on account of the necessity of crow ing so much material into a short time, it was found expedient to f back on the method of quizzing, including of course much in vidual comment and criticism of the textbook descriptions, based personal experience of the professor in Panama and various Arn camps. The students were encouraged to relate their own exp riences, such of them as had served abroad, for instance. The cour was based on Havard's Military Hygiene, which admirably filled t purpose. It is concise, correct, and up to date, and the style su that it makes easy and interesting reading. It is believed that t successful graduates are well grounded in the essentials of the subje and able to take up intelligently practical work in the field.

The following subjects were covered, in more or less detail, parti ular emphasis having been laid on matters pertaining to can hygiene:

Importance of the subject; morbidity and mortality in the milita service in peace and war; death rates; admission rates; noneffecti rates; rates of discharges for disability; influence of climate, rac age, and length of service; the examination of recruits.

Air, its composition and relative humidity; effects of altitude; tmospheric dust; ventilation; air contamination; modern theory f bad effects of ill ventilation; tests of air; amount of space required; ir purification; food; the soldiers' ration; clothing; qualities of texile fabrics; footwear.

Posts, barracks, and quarters; construction and care of same; itchens and mess rooms; the guardhouse; insects and vermin; creening; hygiene of the march; personal hygiene of the soldier; amp sites, their selection and care; tents; improvised and portable arracks.

Water supplies; quantity required; methods of examination of otable waters; purification of water (*a*) by heat, (*b*) by chemical neans, (*c*) by filtration; the Forbes-Waterhouse apparatus; the arnall filter; the Lyster water bag; domestic filters; sand filtraion; mechanical filtration; improvised filtration.

Methods for the disposal of camp excreta; the straddle trench; he pit latrine; the Havard box; post holes; the sanitary trough atrine; disposal of excreta by incineration; disposal of wastes, garage, and refuse; the company crematory; the rock-pile crematory; avatories; the disposal of manure.

Typhoid fever in the military service; history and importance of he subject; paratyphoid fever; the dysenteries; cholera; diarhea and other intestinal diseases; methods of spread; methods of ontrol; antityphoid vaccination in the Army.

Smallpox; vaccination; the other acute exanthemata; measles; umps; meningitis; diseases of the respiratory tract; tonsillitis, ronchitis, and pneumonia; chronic diseases in the Army; tubercuosis; heart disease; the hookworm; skin diseases.

Malaria in the Army; the prophylaxis of malaria; mosquito prohylaxis; screening; drainage; brush cutting; prophylactic adminstration of quinine; dengue; yellow fever; the Stegomyia mosuito; insecticides; typhus fever and its prevention; the effects of old and hot climates.

It is proposed to use as textbooks for the course beginning in July, 917, Vedder's Notes on Sanitation and Lelean's Sanitation in War, he latter containing concise and up-to-date descriptions of methods ow in use by the British. Havard will be assigned for reference and ollateral reading.

This course was completed in 23 hours' instruction.

SANITARY CHEMISTRY.

Lieut. Col. Carl R. Darnall, Medical Corps, professor; First Lieut. yrus B. Wood, Medical Corps, assistant professor.

Value of subject.—Maximum, 600; minimum, 480.

The course consisted entirely of laboratory work with such prelimnary talks by the professor as were necessary to explain the techical procedures. The work of the first section consisted of review f chemical qualitative analysis for metals and solids; quantitative olumetric analysis; qualitative and quantitative chemical examinaion of stomach contents, urine, water, and milk; examination of leaching powder samples for available chlorine, and the preparation f Dakin's solution.

The work of the second section was considerably shortened a condensed, but, with the exception of the urine analysis, all phases the work mentioned above were dealt with.

Ninety-six hours were devoted to instruction in this course.

OPHTHALMOLOGY.

Maj. Theodore C. Lyster, Medical Corps, professor; Capt. Ral H. Goldthwaite, Medical Corps, assistant professor.

Value of subject.—Maximum, 400; minimum, 320.

The course took up first a brief consideration of the optical pri ciples involved in the mechanism of the eye and optical instrumen This was followed by a study of refraction and of the more comm internal pathological conditions of the eye. This theoretical wo was supplemented by practical exercises on the artificial eye and each other to learn the various methods of ophthalmoscopic examin tion; by pictures thrown on screens with explanatory talks, illu trating the common retinal diseases; and by cases brought in fro the soldiers' home showing some of these conditions.

Forty-six hours were devoted to instruction in this course.

BACTERIOLOGY, PATHOLOGY, AND LABORATORY DIAGNOSIS.

Maj. Eugene R. Whitmore, Medical Corps, professor; Maj. Edwa B. Vedder, Medical Corps, Maj. Mathew A. Reasoner, Medical Cor and Capt. Corydon G. Snow, Medical Corps, assistant professors.

Value of subject.—Maximum, 900; minimum, 720.

The course was practical and included the study of the bacter diseases and the identification of the bacteria causing them; bacteri logical examinations of water and milk: spirochaetae; fungi; lectu and practical exercises on agglutinin and precipitins, and lysi lectures and practical work on the Wassermann reaction; lectu and exercises on ferments and anaphylaxis; preparation of b terial vaccines; clinical blood work.

The course in protozoology included the study of amoebae; tri omonas; lamblia, trypanosomes, malaria, etc.

The subject of helminthology was given by lectures, exami tion, and preparation of specimens.

The course in entomology consisted of the study, identificati and differentiation of the disease-carrying arthropods.

Three hours of the course was devoted to the study of venom animals, especially snakes, and venoms and antivenoms.

The shortening of the time devoted to the course made it nec sary to leave out considerable work, such as anaerobes, and the w in general pathology to which considerable time was devoted duri the longer course.

There were frequent practical exercises, in which students w required to work out unknowns arranged as nearly as possible l the work they may expect to meet in the service.

One hundred and thirty hours were devoted to instruction this course.

MILITARY MEDICINE AND TROPICAL MEDICINE.

Maj. Eugene R. Whitmore, Medical Corps, professor.

Value of subject.—Maximum, 800; minimum, 640.

The course in military and tropical medicine consisted of assigned eading in textbooks, and recitations, supplemented by talks where onsidered advisable. The course was given parallel with the course bacteriology, pathology, and laboratory diagnosis, so that when a isease-producing organism was being studied in one course, that isease was being studied in the other course. Special attention as paid to the gross and microscopic study of the tissues in each isease; and many of the sessions were held at the Army Medical useum where the material in the museum was studied.

The course included—

Conditions of military medicine.

Conditions of tropical medicine.

Climate and race: effects of diet, temperature, humidity, and ght, including heat: acclimatization; prophylaxis.

Traumatisms—poisons.

Enteric fever, with special reference to the method of handling hose diseases in the military service; yellow fever; dengue and llied fevers; bacillary dysentery; asiatic cholera; leprosy; plague; alta fever; infectious jaundice; yaws; relapsing fever; syphilis as andled in the Army; typhus fever; sprue; the mycoses, with special tress on sporotrichosis; pellagra; beriberi; amoebic dysentery and moebic liver abscess; trypanosomiasis; the leishmaniases; verruga eruviana and oroya fever; malaria and black water fever; ancyostomiasis; schistosomiasis; and filariasis.

By a method of exchange lectures with the hygienic laboratory f the Public Health Service, two or more lectures were given to he class by members of the staff of the hygienic laboratory. The ubjects of the lectures were typhus fever, plague, leprosy, and abies.

Dr. B. H. Ransom, chief of the division of zoology, Bureau of nimal Industry, Department of Agriculture, gave one lecture on hat was being done in the way of preserving meat, with special eference to trichiniasis.

Fifty-seven hours were devoted to these subjects.

ROENTGENOLOGY.

Maj. Philip W. Huntington, Medical Corps, professor.

Value of subject.—Maximum, 300; minimum, 240.

The course was, so far as possible, a practical one, and each stuent was given an opportunity to personally handle the machine, ake exposures by developing work, and read plates. The diagosis of pathological conditions of the bones and various other rgans of the body was taught and demonstrated according to the ost improved methods, both on the plate and the fluoroscopic creen. Much attention was given to the localization of foreign odies and the diagnosis of fractures. The X-ray treatment of kin and other pathological conditions was also taught.

Sixteen hours were devoted to instruction in this subject.

SANITARY TACTICS.

Maj. Harold W. Jones, Medical Corps, professor.

Value of subject.—Maximum, 500; minimum, 400.

Instruction in this subject embraced drill, the school of the soldi the school of the squad, and the school of the company. As far possible, individual students were allowed to drill platoons and co panies and take their places as guides, platoon leaders, and co pany commanders; indoor exercises were also given illustrating ma euvers by the use of wooden blocks; litter drill; lectures on t organization of the Army, the duties of medical officers in the fie the sanitary units; guard duty, etc.

Setting-up drill was also given daily at noon in the physical e amining room on the sixth floor.

Included in this course were two lectures on military law a courts-martial procedure.

Thirty-two hours were dovoted to instruction in this subject.

EQUITATION.

Capt. Charles G. Harvey, Cavalry, instructor.

This course consisted of instruction in nomenclature of the poi of the horse and parts of the equipment; method of mounting a dismounting: explanation of the military seat; kinds of "hand and proper method of holding reins; "aids" explained and dem strated; moving to front on straight line and halting; changes direction to right and to left; work on road at walk; alternate w and slow trot in hall and on road; suppling exercises; moving front, halting, changes of direction, abouts; movements by threes hall; increases and decreases of gaits; work at slow trot and tr slow trot without stirrups or reins; saddling and bridling; the gall

Eleven hours were devoted to instruction in this subject.

OPERATIVE SURGERY.

No instruction was given on this subject.

PSYCHIATRY.

No instruction was given on this subject and no special prof sors were designated during the 1916–17 session.

During the year a number of special lectures were given, includi one by Dr. Alexis Carrel on hospital service in France, one by Fred H. Albee on bone transplantation, one by Dr. Charles A. Pow on medical service in France, and several by nonmedical lecture Some of these lectures were illustrated with motion pictures a lantern slides. Col. Goodwin, of the British Royal Army Medi Corps, gave a series of very useful and instructive lectures coveri the work of the British officers under field conditions in the trenc and of the field ambulances, including descriptions of evacuations the wounded, gas attacks, etc. Col. Goodwin's lectures are now process of publication by the military surgeon.

In this connection mention is made of the fact that the lect room of the Army Medical School was used twice a week by officers the Quartermaster Department under the direction of the Quart aster General for lectures of instruction to officers of the Quarter-aster Reserve Corps.

ENLISTED PERSONNEL, MEDICAL DEPARTMENT.

The strength of the Medical Department detachment was changed s follows:

	July 1, 1916.	June 30, 1917.
aster hospital sergeants		7
ospital sergeants		
rgeants, first class	5	4
rgeants	3	4
rporals		1
ivates, first class	12	6
ivates		17
	20	39

The character of their services has been of a very high order and e duties and responsibilities of many of them have been such as are rdinarily intrusted only to commissioned officers.

CIVILIAN PERSONNEL.

At the opening of the twenty-first session there were on duty at e school four civilian clerks other than the chief clerk. The in-rease in the work made increases in the force necessary from time to me, until at the close of the period covered by this report there were mployed seven clerks in addition to the chief clerk. A private of e Medical Department who had been on duty as telephone operator as relieved and a civilian appointed on duty at the switchboard. n X-ray technician, a mechanic, a carpenter, and two civilian atchmen were also on duty at the school at the end of the year. heir work was performed in an altogether satisfactory manner and ey were called upon many times to work extra hours, which was variably cheerfully done. The work of the chief clerk, Mr. Ayers, as most exacting and his office was called upon to expand and take p new lines of work over and over again.

GRADUATION.

Very informal closing exercises for the first section were held, at hich the Surgeon General delivered a short address and presented e diplomas to the corps. Owing to the exigencies of the service, losing exercises for the second section were omitted.

Of the first section there were three honor graduates: Walcott enison, Calvin H. Goddard, and Edgar E. Hume.

Of the second section there were two honor graduates: Walter J. ristow and George S. Woodard.

Owing to the fact that the third section of the twenty-first session f the school will not close until after the period covered by this eport, no selections for award of either the Hoff memorial medal or he Sternberg medal were made.

At the time the building now occupied was taken over it seemed t be more than adequate for any contingency that might arise. A the present time, however, there seems to be good ground for th belief, which is justified by past experience, that a further extensio of the school might be necessary. A possibility for such an extensio exists in an adjoining building which is now for rent and which ca probably be altered to suit the requirements. Steps will probably b taken in the near future toward a recommendation for the rental c this building as preparation for any future demands which may b made upon the school.

RECOMMENDATIONS.

Toward the latter part of the period covered by this report is wa believed desirable that instruction in French conversation should b made a part of the curriculum of the school. No definite plans wer made, but it is expected that steps will be taken by the opening of th session for the next section, during the month of July, to have special instructor placed on duty here for the purpose of givin instruction in French conversation to the classes.

In September, 1916, the Army Medical School and laboratori were moved from the cramped and inconvenient building (72 Thirteenth Street), of which it occupied only the upper floors, to th much more commodious building (462 Louisiana Avenue) it no occupies. This building is very well adapted to the purpose and wi serve very well as a temporary makeshift until such time as a buil ing can be specially planned and erected for the purpose. The preser building, though a great improvement over the one vacated la September, is lacking in one of the features essential, in my opinio to the proper instruction of student officers—that is, grounds sufficient extent to make it possible to put the entire class in cam for part of the session, and to give facilities for drill and field exe cises. The recommendation is renewed that such a building erected as soon as funds are available, as near the city as practicabl in grounds extensive enough for the purposes indicated.

The present building, large as it is, is overcrowded and its capaci taxed by activities not directly connected with the school, especial the great number of physical examinations mentioned in the repo (pp. 3 and 4). The three-story and attic building to the east of th building can be rented for $200 a month, connected by doors on th first, second, and third floors of this building, and would great facilitate the work. Steps have been taken to get authority to ad the next-door building to the school, to be used, first floor for offic second floor for additional room for clerks and records, third flo for physical examining rooms, the present room used for that pu- pose being very much needed for a typhoid vaccine packing roo the present packing room being overcrowded.

ARTICLES BY MEDICAL OFFICERS.

Note.—It is desired to include in this list all articles written by medical officers uring the fiscal year. It is therefore requested that the title and place of publica-on of articles written by medical officers be sent to the Surgeon General.

Articles by medical officers of the Army, July 1, 1916, to June 30, 1917.

Author.	Articles.	Disposition.
llen, Lieut. Col. John H	The administrative technique of antityphoid inoculations.	Military Surgeon, June, 1917.
llen, Maj. W. H	The ambulance company	New York Medical Journal, June, 1917.
rthur, Col. William H	The advantages of military training for young men.	Military Surgeon, January, 1917.
Do	Carrel's method of wound sterilization.	Military Surgeon, May, 1917.
sh, First Lieut. J. Earle	A note on the pathological effects of atmospheres rich in oxygen.	American Journal of Laboratory and Clinical Medicine, February, 1917.
shford, Col. B. K	The etiology of sprue	American Journal of the Medical Sciences, August, 1917.
shford, Maj. Mahlon	The American doctor and preparedness.	New York Medical Journal, Apr. 14, 1917.
Do	The most practical plan for the organization, training, and utilization of the medical officers of the Medical Officers' Reserve Corps of the United States Army and Navy, and of the medical officers of the Officers' Reserve Corps of the United States Army, in peace and war—the Wellcome first prize essay.	Military Surgeon, February, 1917.
Do	Proposed motor-ambulance company.	Military Surgeon, September and October, 1916.
aketel, Maj. H. S., Medical Reserve Corps.	The necessity of analyzing drugs for Army use.	Pacific Medical Journal, vol. 59, 1916 (pp. 658–662); also Medical Times, New York, vol. 44, 1916 (p. 330).
ernheim, Capt. J. R., Dental Corps.	Oral hygiene in the Army	Read at the meeting of the National Dental Association, Louisville, Ky., July 25–28, 1916. Journal of the National Dental Association, May, 1917.
oak, Capt. S. D., Dental Corps.	Militia dental surgeons	The Bulletin of the Association of Military Dental Surgeons of the United States.
ushnell, Col. G. E	The diagnosis of tuberculosis in the military service.	Military Surgeon, June, 1917.
hamberlain, Col. W. P	Care of troops on the Mexican border.	Journal of the American Medical Association, Nov. 25, 1916.
Do	Demography in so far as it relates to the vital statistics of armies.	Military Surgeon, December, 1916, January, February, and March, 1917.
Do	Military medicine	Boston Medical and Surgical Journal, April, 1917.
hurch, Col. James R	Notes on the organization of the French sanitary service.	Military Surgeon, May, 1917.
onnor, Lieut. Col. C. H	The special physical examination of aviators for the United States Army.	Military Surgeon, January, 1917.
raig, Lieut. Col. Charles F	The classification of the parasitic amebæ of man.	Journal of Medical Research, January, 1917.
Do	The complement fixation test in the diagnosis of tuberculosis.	Journal of the American Medical Association, Mar. 10, 1917.
Do	The occurrence of entamebic dysentery in the troops serving in the El Paso district from July, 1916, to December, 1916.	Military Surgeon, March and April, 1917.
Do	The practical application of the Wassermann test in the diagnosis and as a control of the treatment of syphilis.	American Journal of Syphilis, January, 1917.

Articles by medical officers of the Army, July 1, 1916, to June 30, 1917—Continued.

Author.	Articles.	Disposition.
Culler, Maj. R. M.	Syphilis of the stomach—a case of hourglass contraction.	Journal of the American Medic Association, Dec. 2, 1916.
Davidson, Lieut. Col. W. T.	Bone autogenous graft in the treatment of fracture of the greater tuberosity of the humerus.	Annals of Surgery, Philadelphi Pa., July, 1917.
Do	Rider's tendon	
De Lanney, First Lieut. E. L., Medical Reserve Corps.	Treatment of amebic dysentery with the Chaparro Amargosa.	Awaiting publication.

SANITARY TROOPS—NATIONAL GUARD.

Due to the influence of the European war there has been an unrecedented activity during the past year in both the organization nd training of the sanitary units and detachments of the National uard.

Since the date of the last report, 21 field hospitals and 21 ambuance companies have been organized and extended Federal recogition. In addition 93 sanitary detachments have been organized for line organizations, making a total of 59 field hospitals, 47 ambulance companies, and 267 sanitary detachments, which were drafte into the Federal service August 5, 1917.

The following table shows the existing sanitary units in the Federa service and the number required for the 16 National Guard divisions:

Division.	States comprising National Guard Divisions.	Organized.	Shortage.
Fifth	Maine, none; New Hampshire, 1 F. H.; Vermont, none; Massachusetts, 2 F. H. and 2 A. C.; Connecticut, 1 F. H. and 1 A. C.; Rhode Island, 1 A. C.	4 F. H. 4 A. C.	None.
Sixth	New York, 4 F. H. and 4 A. C.	4 F. H. 4 A. C.	Do.
Seventh	Pennsylvania, 4 F. H. and 4 A. C.	4 F. H. 4 A. C.	Do.
Eighth	New Jersey, 1 F. H. and 1 A. C.; Delaware, none; Maryland, 1 F. H. and 1 A. C.; District of Columbia, 1 F. H.; Virginia, 1 F. H. and 1 A. C.	4 F. H. 3 A. C.	1 A. C. Delaware.
Ninth	North Carolina, 1 F. H. and 1 A. C.; South Carolina, 1 F. H.; Tennessee, 1 F. H. and 1 A. C.	3 F. H. 2 A. C.	1 F. H. Tenn., 2 A. C. (1 Tenn 1 S. Car.).
Tenth	Alabama, 1 F. H. and 1 A. C.; Georgia, 1 F. H.; Florida, 1 F. H.	3 F. H. 1 A. C.	1 F. H. (Ga.). 3 A. C.
Eleventh	Michigan, 1 F. H. and 2 A. C.; Wisconsin, 2 F. H. and 2 A. C.	3 F. H. 4 A. C.	1 F. H. (Mich.)
Twelfth	Illinois, 4 F. H. and 4 A. C.	4 F. H. 4 A. C.	None.
Thirteenth	Minnesota, 1 F. H. and 1 A. C.; North Dakota, 1 F. H.; South Dakota, none; Iowa, 2 F. H. and 2 A. C.; Nebraska, 1 F. H.	5 F. H*. 3 A. C.	1 A. C. (Nebr.)
Seventeenth	Kentucky, 2 F. H. and 1 A. C.; Indiana, 2 F. H. and 3 A. C.	4 F. H. 4 A. C.	None.
Eighteenth	Arkansas, 1 F. H. and 1 A. C.; Mississippi, 1 F. H.; Louisiana, 1 F. H.	3 F. H. 1 A. C.	1 F. H. (Miss.), 3 A. C. Miss., 1 La.).
Nineteenth	California, 2 F. H. and 2 A. C.; Utah, 1 F. H.; Arizona, none; Colorado, 1 F. H.; New Mexico, none; Nevada, none.	4 F. H. 2 A. C.	2 A. C. (1 Utah, 1 Colo.).
Twentieth	Washington, 1 F. H.; Oregon, 1 F. H.; Montana, none; Idaho, 1 F. H.; Wyoming, none.	3 F. H. No A. C.	1 F. H. (Wyo.), 4 A. C. Wash., 1 Oreg., Idaho, 1 Wyo.).
	Total	59 F. H. 47 A. C.	5 F. H. 17 A. C.
	Total units	106	22

* F. H. in excess in this division.

The commissioned personnel of the medical department, Nationa Guard, on August 5, 1917, whose eligibility under the act of June 1916, was passed upon by this bureau, and were recognized, consiste as follows: 1,407 medical officers, 53 reserve medical officers, 30 dentists, and 81 veterinarians, a total of 1,848 officers. The reserv officers were not drafted into the Federal service, as they were no included in the call of the President. The medical officers of th State staff corps were not included in the call. However, a numbe of these were drafted later to fill vacancies, and for the division staff. The States of Arkansas and Texas had an excess of eligibl dental surgeons, who were not drafted into the Federal servic Exclusive of the medical officers of the States staff corps and reserv there was a deficiency of approximately 60 officers for the Nationa Guard drafted into the Federal service. If the National Guar reserve medical officers and the remainder belonging to the Stat staff corps are drafted into the Federal service, the medical department of the National Guard will have its full quota required by Table

Organization, 1917, for the National Guard drafted into the Federal rvice.

The enlisted personnel of the medical department had, on August the maximum strength authorized by Tables of Organization, 1917, e approximate strength being 19,000.

A considerable number of medical officers, whose efficiency records the Texas border were reported as excellent, severed their con-ection with the National Guard: some for personal reasons, others accept commissions in the Officers Reserve Corps of the Army, hich gave them better opportunity for advancement. Con-quently, about 50 per cent of the present commissioned personnel ve had no prior military service.

INSTRUCTION AND TRAINING.

The few officers and noncommissioned officers of the Regular edical Corps, assigned to duty with the medical department of e National Guard, were used for various duties, so that very little struction was given the sanitary troops by the Regular Establish-ent. A uniform and progressive course of armory instruction was escribed for the sanitary units and detachments, which was for e most part conscientiously followed by the responsible National uard medical officers. Schools for officers and noncommissioned ficers were established and a special course of instruction was escribed. The medical officers correspondence course had to be andoned for lack of inspector-instructors to supervise it.

EXAMINATIONS UNDER THE ACT OF JUNE 3, 1916.

Due to the nonavailability of regular medical officers to supervise d act as members of boards, this bureau was unable to convene ards of medical officers to examine persons appointed and pro-oted in the medical department, National Guard, as required under e act of June 3, 1916. One board was convened for this purpose in e State of Connecticut, where there was a retired medical officer on ty. Upon recommendation of this bureau, these examinations ere turned over to department commanders. They, however, were ly able to determine the qualifications of a few applicants for pointment and promotion in the medical department. The igibility of all appointments was passed upon by this bureau, and pointments authorized, subject to future examinations, which has sulted in securing a high grade of medical officers.

EQUIPMENT.

The supply departments have been unable to furnish full equip-ent or supplies to the National Guard since January 1, 1917, so that newly organized field hospitals and 22 ambulance companies were t equipped August 5, 1917. Forty field hospitals and 25 ambu-nce companies were supposed to be fully equipped, and had imal-drawn transportation, but not the animals.

Tables of Organization, 1917, require that half of the units of the nitary train have motor-drawn transportation. From funds propriated this bureau, the Surgeon General's Office placed contracts for 265 motor ambulances and 105 motorcycles to equip 2 field hospitals and 23 ambulance companies with motor equipmen The total cost of this equipment, some of which has been delivere amounted to $488,300. The furnishing of motor trucks and cars f these units pertains to the Quartermaster Corps. They were unab to furnish this equipment prior to the draft of the National Guard.

Early in 1917, $94,500 was allotted to the Ordnance Departme from funds appropriated this bureau for furnishing 1,200 officer belts (par. 864, M. M. D.), and 6,600 enlisted men's belts (par. 86 M. M. D), including the necessary pouches and tags, and ration bag These articles were intended for equipping the commissioned a enlisted personnel, medical department, National Guard, to repla old and obsolete equipment, and delivery was to be made in Jul 1917. None were issued to the National Guard prior to the draft.

Indiana Ambulance Company No. 3, Michigan Ambulance Co pany No. 2, and Wisconsin Ambulance Company No. 1, were fu nished complete standard motor equipment by private person approved by the War Department.

MEDICAL DEPARTMENT TRAINING CAMP.

With a view to providing an adequate number of trained medic officers of the National Guard who could take up the work of traini and instructing the sanitary personnel and line troops at conce tration camps, which could not be furnished by the Regular esta lishment, 257 medical officers and 762 enlisted men of the Natio Guard from among those not in the Federal service, and who we not on the border, were called into the Federal Service in June, a sent to the medical department training camps at Fort Oglethor Ga., Fort Riley, Kans., and Fort Benjamin Harrison, Ind., for three months course of intensive training. In addition, one fi hospital and one ambulane company, National Guard, were request to be sent to each of these camps for the purpose of aiding in givi instruction to the student officers and enlisted men in attendan none from the Regular establishment being available for this purpo Those selected were Field Hospital No. 1 and Ambulance Compa No. 1, Tennessee, to Fort Oglethorpe, Ga.; Field Hospital No. 1 a Ambulance Company No. 1, Indiana, to Fort Benjamin Harris Ind.; and Field Hospital No. 1 and Ambulance Company No. Missouri, to Fort Riley, Kans. Four medical officers, Natio Guard, were requested called into Federal service, for the purpose instructors at medical department training camps.

MEDICAL EXAMINATIONS.

Prior to the act of June 3, 1916, the War Department had mandatory authority concerning the physical requirements of personnel of the Organized Militia not in Federal service, althou all but four States claimed to have adopted the standard of physi examination prescribed for the Regular Army. These requireme were not rigidly enforced by the States, as evidenced by the la number found physically disqualified upon muster into the Fed service, under the calls of May 9 and June 18, 1916. The mobili tion report, Organized Militia, 1916, shows that from data availa iere were 23,721 rejections out of a total of 128,517 persons exam- ed, making an average of 18.45 per cent rejected on account of hysical defects.

It might be interesting to compare the above with the mobiliza- on of the National Guard in 1917. From the data available presenting 39 States, there were 11,762 rejections out of 121,721 amined, making an average of 9.9 per cent rejected on account of hysical disabilities.

CAUSES OF REJECTION.

The following is a tabulation of the causes of rejection on account physical disabilities:

Cause.	1916—5 States, 35,824 troops examined.	1917—39 States, 121,721 troops examined.
nereal diseases	287	1,026
or physique, under height and weight	1,731	1,932
efective vision and diseases of the eyes	741	1,503
eformity of feet and flatfoot	414	1,359
nputations and deformities	195	612
oiter	57	67

iseases of the nose and throat	24	108
eins, arteries, and varicosities	80	158
ydrocele and varicocele	89	308
ernia	396	1,032
efective dentition	249	629
efective hearing	96	401
verweight and obesity	65	35
ervous diseases	19	113
emorrhoids	43	144
eart and lungs	724	1,291
iteracy	49	10
in diseases	26	7
coholism and drug habits	12	62
nclassified	189	820
Total	5,526	11,762

CONSTRUCTION AND REPAIR OF HOSPITALS.

During the past year plans and specifications were prepared for nlarging and improving the hospital buildings at various military osts and general hospitals.

Letterman General Hospital, San Francisco, Cal.—Contracts were ntered into for additional concrete wards, and a second story on the acteriological laboratory. A new concrete ward, an addition to the urses' dormitory, and an addition to the department laboratory were ompleted for this general hospital.

Fort Bliss, Tex.—A rear annex containing kitchen and mess room, nd dormitories for the Hospital Corps was completed, and the base ospital at this post, used in caring for the sick from the Mexican order, was enlarged and improved.

Fort Sam Houston, Tex.—The building to house a central heating lant, a department laboratory, dormitories for the Hospital Corps, nd a surgical pavilion were completed so far as contracted for. A ew kitchen addition was added to the hospital, and the mess room as enlarged. The porches were screened, and various improvements were added for the purpose of placing this hospital in the mo sanitary condition.

Temporary buildings for hospital purposes were also provided fro the appropriation for construction and repair of hospitals at numerou places along the Mexican border for the care of the sick, and $500,0 was used for these temporary structures.

An allotment of $50,000 was made from the appropriation f construction and repair of hospitals for use in the Philippine Depar ment, and $1,000 was allotted from the appropriation for quarte for hospital stewards, for quarters for noncommissioned officers the Philippine Islands.

In addition to the foregoing, all general hospitals in connecti with the Army and the hospitals at military posts were improved kept in proper repair so far as funds would permit. Tempora hospitals for standing camps and cantonments were also provid in a number of cases.

The porches of the Army and Navy general hospital have be inclosed with glazed sash, thus materially increasing the bed capacit and no additional new construction is thought to be necessary present.

General Hospital, Fort Bayard, N. Mex.—Funds to build an office infirmary for this general hospital, $60,000, have been authoriz by Congress, and the following additional buildings are necessar One infirmary for enlisted men, estimated to cost $100,000; o addition for the officers' dormitory, estimated to cost $80,000; o new ward, estimated to cost $75,000; one ward for ambulant patien estimated to cost $60,000; also one amusement hall and librar estimated to cost $30,000; and funds for these buildings have be included in the annual estimate for the fiscal year 1918.

Letterman General Hospital, San Francisco, Cal.—The wards this general hospital, with the exception of a few which have be replaced with reinforced concrete buildings, are constructed of woo have been in use for quite a number of years, and are dangerous case of fire. These wooden wards are being replaced gradually fro time to time with concrete buildings, and $75,000 is included in t annual estimate for 1919, to be used for this purpose.

Walter Reed General Hospital, Takoma Park, D. C.—This is o of the most important general hospitals and is used for the treatme of officers, retired officers, patients from Washington Barracks, e listed men, special cases, observation of patients under considerati for discharge on account of disability, and for the education students attending the Army Medical School. Funds are includ in the appropriation made for the current fiscal year, $90,000, place additional stories on Wards A and B. When these improv- ments are added, much needed room will be secured, but furth expansion will be necessary in the near future. An item of $350,0 is included in the annual estimate for 1919, to build an Army medi school on this reservation, thus placing the hospital and the sch in close proximity and saving a large sum annually paid for a rent building.

New modern hospitals are required for several military posts replace dilapidated wooden structures. A new hospital is need for Fort Michie, N. Y., and $40,000 is included in the estimate

19 to be used for this purpose. A new hospital is also needed for ›rt Dade, Fla., and $45,000 is included in the estimate for 1919, to ver the cost of the same. In addition, an item of $40,000 is included the estimate for 1919 to provide an isolation ward, a prison ward, ıd a morgue for the hospital at Fort Mills in the Philippine Islands.

Owing to the necessity for hospitals to care for sick and wounded casioned by the present war with Germany, large sums will be quired, and the annual estimate for the fiscal year 1919 calls for 5,000,000 which, under ordinary circumstances, would be a large m, but these funds are not only for general hospitals and hospitals military posts, but they are also to provide for the alteration of ırmanent buildings at posts for use as hospitals, construction and pair of temporary hospital buildings at permanent posts, construc- ›n and repair of temporary general hospitals, rental of grounds ıd rental and alteration of buildings for use for hospital purposes the District of Columbia and elsewhere, including necessary tempo- ry quarters for hospital personnel, outbuildings, heating and laun- y apparatus, plumbing, water and sewers, and roads and walks r the same.

Quarters for noncommissioned officers of the Medical Department.— ving to the limited appropriation for these buildings, it was not ssible to erect additional quarters, and various necessary additions d improvements had to be disallowed. A number of large military sts are in need of such quarters for these noncommissioned officers d the appropriation should be liberal until such time as suitable bitations are supplied.

MEDICAL AND HOSPITAL SUPPLIES.

FINANCES.

The appropriation made by Congress for the fiscal year 1917 was ,500,000.

From the time war was declared until the 1st of July (two and a lf months) the supply division had compiled estimates of the quirements of 1,000,000 men for one year and had actually placed ntracts for $11,712,000 worth of medical supplies, under the urgent ficiency act, approved June 15, the deliveries called for being such to insure an adequate amount being on hand when the National my camps were opened.

PURCHASE AND DISTRIBUTION OF MEDICAL SUPPLIES.

In order to assure the prompt furnishing of medical supplies for an my in the field, three important duties devolve upon the supply vision of the Medical Department, as follows:

Procurement of the supplies in sufficient time to deliver them to e distributing points before they are required. The needs for six ›nths in advance must be anticipated. Large purchases must be ıde and a reserve supply be on hand for emergencies. Twelve ›nths' supply should be in sight.

Transportation of these supplies to suitable distributing points for ue to the troops. This was materially facilitated on the border by the cooperation of the Quartermaster Corps and the railroa Cars were tagged with distinctive labels or cards, indicating th character and that they were Government stores.

Distributing points must be easy of access. The supplies m be issued with the least possible delay. The number of offi through which requisitions pass must be reduced to the minim compatible with the conservation of the supplies. This was acco plished in the Southern Department by authorizing the officer charge of the depot to make issues without reference to hig authority.

To facilitate the purchase of the large quantities of medical s plies necessary for the war, the medical supply depots at New Y City, N. Y., Washington, D. C., and St. Louis, Mo., have been grea expanded. New buildings have been leased, and arrangements being made with the railroad companies to run spur tracks dir to these depots. During the war all post supplies will be purcha at New York, field supplies at Washington, and veterinary supp at St. Louis.

To facilitate the distribution of these supplies, four new subsidi depots have been established. The supplies will be transferred bulk from the purchasing depots to the subsidiary depots, whe they will be issued on approved requisitions to all military posts camps. The new issuing depots are located at Philadelphia, Atlanta, Ga., Chicago, Ill., and France.

The supply depots formerly established at San Antonio, T San Francisco, Cal., Honolulu, Hawaii, and Manila, P. I., will tinue their functions as issuing depots. The medical supply de at El Paso, Tex., has been abandoned, and all supplies form issued from that depot will be issued by the San Antonio depot.

In addition to the above, a motor-ambulance supply depot been established at Louisville, Ky. All motor ambulances will assembled at and distributed from this depot. A standard typ motor ambulance has been adopted by the ambulance board. standard body can be readily adapted to fit any chassis.

MEDICAL SUPPLIES FOR MEXICAN BORDER.

The medical supply depots in the Southern Department form established at San Antonio and El Paso, Tex., to supply the tr along the border and in Mexico, brought this work to a succe conclusion. The inspector general reported that the medical plies had been promptly furnished, and in sufficient quantities.

DECENTRALIZATION.

On account of the war, department surgeons and division surg have been authorized to call upon the medical supply officers in t vicinity to issue standard medical supplies, without reference to Surgeon-General's Office.

CANTONMENT UNITS.

In order to avoid possible confusion and delay in the equipr of cantonment hospitals, the large purchasing depots were furni with a list of supplies known as a cantonment unit, with instru o assemble a sufficient number for the camps in their vicinity. As oon as the cantonment hospitals are completed instructions will be iven to ship these units to them. They will be used as a nucleus or base hospitals, additional supplies being furnished on requisition rom time to time as needed.

MEDICAL SUPPLY DEPOTS AT CAMPS.

A medical supply depot is also being established at each of these amps. It will be stocked with expendable articles for routine ssues to camp infirmaries. Standard medical supplies will there-ore be available at every camp.

VACCINES.

Typhoid and paratyphoid vaccines have been forwarded in bulk rom the Army Medical School, Washington, D. C., to the various nedical supply depots, including those located at the cantonments, vhence they are issued direct to post surgeons and camp surgeons.

Arrangements have been made through the biological committee f the Council of National Defense to have an ample supply of small-ox vaccine available in the vicinity of each camp, to be promptly urnished to the camps upon request of the medical supply officers.

BLANK FORMS.

Blank forms have also been placed in all the supply depots, to be mmediately available for distribution as needed.

SSISTANCE RENDERED BY COMMITTEES OF COUNCIL OF NATIONAL DEFENSE.

The various committees of the medical section, Council of National efense, have materially assisted the Medical Department in effecting he purchase of enormous quantities of supplies. In this connection articular mention should be made of the activities of the surgical nstruments committee.

SURGICAL INSTRUMENTS.

Eighty per cent of the surgical instruments in this country were ormerly made in Germany. As a result of the activities of this ommittee, arrangements have been made to supply the Army and avy and contracts let for the necessary instruments. This has een accomplished only after the most strenuous endeavor and the tilization of all resources in this country.

X-RAY APPARATUS.

The officer in charge of this work has been a member of the sub-ommittee of the Council of National Defense, which has charge of he standardization of apparatus, and has also acted in an advisory apacity to the supply division of the American Red Cross. This as made it possible to compile a standard list of X-ray apparatus, which has been adopted by the Council of National Defense and adhered to in all essentials by the supply division of the Surgeon-General's Office and by the Red Cross. This standard list includes both stationary and portable apparatus.

The machines of those manufacturers whose apparatus has met the specifications are set up and in operation at Cornell Medical College, in New York City, where a school has been established for instruction in military roentgenology. Branch schools have also been established in eight other cities for instruction in this work.

By cooperation with a committee of the American Roentgen Ray Society, methods of localization of foreign bodies have been standardized and instrument manufacturers are now making up the various standard instruments for this work.

Manufacturers of X-ray apparatus have cooperated with this department so thoroughly that there will probably be no difficulty in securing all of the apparatus needed throughout the duration of he war at a fair price to the Government.

ARTIFICIAL LIMBS AND APPARATUS.

Under the laws relating to artificial limbs and apparatus, or commutation therefor, orders on manufacturers were given during the fiscal year for 20 artificial legs and 1 arm. Commutation certificates were issued for 126 cases of amputated leg, 55 of amputated foot and 901 cases of loss of use of limb.

Under the act of June 17, 1870, and subsequent amendments thereto, 23,741 disabled soldiers and sailors have been furnished artificial limbs and apparatus, or have received commutation in money, since the passage of the act, as follows:

Total number benefited to June 30, 1917	23, 74
Died	16, 60
Dropped from rolls	59
Rejected after one or more payments	57
Remaining on the rolls at the end of the fiscal year	5, 97
Loss of beneficiaries during the year	51

APPLIANCES AND TRUSSES.

Eighty-one appliances were issued during the fiscal year endin June 30, 1917, and 153 trusses for disabled soldiers were furnishe and fitted.

ARMY MEDICAL MUSEUM.

The total number of specimens in the museum at the close of the fiscal year June 30, 1917, is 47,681.

The following statement shows in detail the additions and changes in the different sections:

Pathological section:		
In museum June 30, 1916		13,089
Discarded		2
		13,087
Received during the year		55
In museum June 30, 1917		13,142
Anatomical section:		
In museum June 30, 1916		1,251
Discarded	2	
Donated	1	
		3
		1,248
Received during the year		40
In museum June 30, 1917		1,288
Comparative anatomy section:		
In museum June 30, 1916		601
Received during the year		1
In museum June 30, 1917		602
Microscopical section:		
In museum June 30, 1916, and June 30, 1917		12,916
Miscellaneous section:		
In museum June 30, 1916		4,014
Discarded		1
		4,013
Received during the year		205
In museum June 30, 1917		4,218
Provisional anatomy section:		
In museum June 30, 1916, and June 30, 1917		293
Photographic section, including negatives:		
In museum June 30, 1916		15,149
Photographs received during the year		73
In museum June 30, 1917		15,222

RECAPITULATION.

In museum June 30, 1916	47,313
Discarded and donated	6
	47,307
Received during the year	374
In museum June 30, 1917	47,681

The following are some of the more interesting specimens receive during the year ending June 30, 1917:

Malformations.—Specimen 14672, human fetus at 7½ months showing cranior achischisis; contributed by Dr. H. C. Macate Washington D. C. Specimen 14652, atresia ani; infant died tent day; apparent cause, prenatal adhesions; contributed by Dr. J. R Wellington, Washington, D. C.

Interstitial pregnancy.—Specimens 14647–14648, uterus, appendage and fetus; removed and contributed by Dr. I. S. Stone, Washingto D. C.

Shot fractures of jaws.—Specimens 14661–14671, series of plaste casts from European War of 1914–1917, showing results of dent operative work; made and contributed by Dr. William C. Speakma Wilmington, Del.

Fibrosarcoma of clavicle.—Specimen 14650, removed by operatio from soldier, age 23; contributed by Lieut. Col. H. A Webbe Medical Corps, United States Army.

Brain.—Specimen 14631, endothelioma of left middle front gyrus; soldier, age 32; contributed by Capt. G. I. Jones, Medic Corps, United States Army. Specimen 14657, softening and he orrhage; from an Army officer; contributed by Maj. P. M. Ashbur Medical Corps, United States Army. Specimen 14683, leptome ingitis; no history; contributor unknown.

Spinal cord.—Specimen 14675, tumor; contributed by Fir Lieut. H. G. Maul, Medical Corps, United States Army.

Eye.—Specimen 14673, melanotic sarcoma; from girl 3 years ol removed and contributed by Dr. D. K. Shute, Washington, D. C.

Nose.—Specimen 14645, screw worms removed from nose of so dier who had ozena; 152 worms; contributed by Maj. G. E. Youn First Arizona Infantry.

Circulation.—Specimen 14630, aneurism of arch of aorta, ruptu into left pleural sac; soldier, age 44; contributed by Capt. H. Nichols, Medical Corps, United States Army. Specimen 1465 Hodgkin's disease; tumor of lymph nodes in mediastinum; le lung also involved; from a Philippine Scout, age 26, who died lobular pneumonia; contributed by Lieut. H. G. Maul, Medic Corps, United States Army. Specimen 14681, lymphosarcoma lymph nodes of neck and superior mediastinum; from soldier, a 28; contributed by Lieut. J. S. Gaul, Medical Corps, United Stat Army.

Lung.—Specimen 14679, sarcoma, secondary to sarcoma of l which was amputated; retired soldier, age 78; contributed by Ca A. D. Tuttle, Medical Corps, United States Army. (See also 1468 kidney.)

Esophagus.—Specimen 1453, carcinoma of pharyngeal en retired soldier, age 82; contributed by Capt. A. D. Tuttle, Medic Corps, United States Army.

Stomach.—Specimen 14656, solitary ulcer; death from hem rhage; retired soldier, age 84; contributed by Capt. A. D. Tutt Medical Corps, United States Army.

Small intestine.—Specimen 14636, sarcoma; soldier, age 26, co tributed by Lieut. F. H. Petters, Medical Corps, United States Arm Two specimens of paratyphoid A, ulcer, 14651, from soldier, age contributed by Capt. G. F. Lull, Medical Corps, United States Arm e other, 14654, from a soldier, age 27; one ulcer had perforated; ntributed by Capt. H. H. Johnson, Medical Corps, United States rmy.

Liver.—Specimen 14660, necrobacillosus; from a cow that sud-nly died; contributed by Dr. C. B. Robinson, veterinary surgeon, ashington, D. C. Specimen 14640, multiple abscesses of liver; om Army officer, age 40, who had had malaria; died of septicemia; ntributed by Lieut. F. H. Petters, Medical Corps, United States rmy.

Kidney.—Specimen 14676, prosphatic calculi removed from pelvis ureter; soldier; contributed by Lieut. H. G. Maul, Medical Corps, nited States Army. Specimen 14680, cyst of kidney; same case 14679, sarcoma of lung; retired soldier, age 78; contributed by apt. A. D. Tuttle, Medical Corps, United States Army.

Urinary bladder.—Specimen 14643, carcinoma; retired soldier, age ; contributed by Lieut. B. L. Wilson, Medical Reserve Corps, nited States Army.

Testicle.—Specimen 14641, primary carcinoma; secondary foci in ng (see 14642); civilian, age 30; contributed by Capt. A. D. Tuttle, edical Corps, United States Army. Specimen 14678, tuberculosis of sticle; removed and contributed by Lieut. F. H. Petters, Medical orps, United States Army.

Mammary gland.—Specimen 14634, large cysts of female mammary and; contributed by Dr. E. C. Folkmar, Washington, D. C.

Miscellaneous section.—Specimen 4192, plaster cast of hand of resident Lincoln. Specimen 4195, plaster cast of hand of Keller, the restidigitateur. Specimen 4194, model of central nervous system, evised by Prof. Gaylord P. Clark. Specimen 4210–4211, plaster cast the "Piltdown" skull. Specimen 4221, German gas mask; con-ributed by Lieut. E. F. Riggs, United States Army. Specimens 222–4224, French gas mask and appurtenances; contributed by ieut. Col. Spencer Cosby, United States Army. Specimens 4242 and 267, British gas masks, contributed by Col. A. E. Bradley, United tates Army. Specimen 4217, fragments of a Zeppelin that was lown up; contributed by Maj. W. J. L. Lyster, Medical Corps, United tates Army. Specimen 4239, British helmet perforated by missile; ntributed by Maj. Lyster. Specimen 4240, British helmet perfo-ated by rifle bullet; contributed by Col. A. E. Bradley, United States rmy. Specimen 4268, British trench litter; contributed by Asso-iation of United States Military Surgeons. Specimens 4275 to 4387, ries of medals, purchased.

Photographs.—Specimens 4094 to 4118, series of photographs of ot injury of face, from European war 1914–1917, contributed by r. William C. Speakman, Wilmington, Del.
